While this is not strictly a scientific subject, yet it is an allied one and one that should be close to the heart of every member of the medical profession. There are few problems confronting the profession today of more interest or possessed of more grave results, than the tendency to resort to or accept that most flagrant of all abuses "advertising". There exist in every community men whose intellects have not been quickened or their consciences impressed with the importance of ethics. On the contrary the commercial microbe has been sown and multiplied in the gray matter of their exaggerated ego until they are willing to commercialize their profession and trail under their dirty feet the principles on which the success of their profession has depended.

In talking to different members of this Society about a paper on this subject, I have had various suggestions offered. One says, "Make it raw"; another says, "They all advertise in some way; handle it judiciously". If "making it raw" means to use a hammer, or embarrass the guilty, if any there may be,—allow me to say that such is not my object; or if handling it judiciously means to handle it with gloves on and harmonize with or apologize for the guilty, I cannot be judicious to such a point. My object is to speak on this subject in a general way and consider its effects on the profession as a whole. I shall not regard the feelings of the little, selfish, narrow minded violator of our time-honored customs who tries to advertise himself and not methods, for by his conduct he has divorced himself from the profession and should have no consideration in the affairs of physicians; but what I wish to do is to send out the S. O. S. call to those of the profession who are inclined to sit by with a passive indifference and permit these irregular 2½ percent or near professionals to "rock the boat" of professional success.

From the beginning of medicine the profession has been controlled by a so-called code of ethics. One of the unwritten laws of that code is that physicians shall not advertise, and that no ethical physician would advertise in any way. In the rules governing the profession

*Read before the Randolph County Medical Association, May 8th, 1922, and referred for publication in The Journal.

it has also been a written law that advertising was irregular and unprofessional. This applied to all of the allied branches of the profession, county, state, and national associations have legislated against it, and faculties in medical institutions have taught us a refrain from it. Boards of examination and registration have implied in our permits to practice medicine an agreement not to advertise. Physicians admitted under reciprocity are required to sign a contract not to advertise. Osteopaths, chiropractors and others applying for permission to practice are required to sign the same contract. The object has been to teach that the profession of medicine is a profession and not a business, and that any attempt to commercialize it was regarded unprofessional and a violation of the controlling code. We have built upon a foundation which has been strong,—strong enough to guide us in the confidence of the people at peace with one another, and respected by mankind in general; but indications now are that the foundations upon which we have built is tilting, and that the pendulum which marks the conditions that exist is swinging far from center. We are taking into our societies under the guise of full membership and good fellowship too many physicians who have no regard for ethics. They are too prone to ignore the admonitions of the past, and resort to the newspapers and other methods of getting their names before the people. Medical journals have printed articles expressing very liberal views on this subject, and we have accepted them with a passive indifference until at the present time advertising is accepted as almost legitimate.

When a young man begins casting about to decide on a business or profession to which he expects to dedicate his life's service, one of the first things he should consider is the rules and regulations governing that particular profession, and if he cannot enter that profession and conduct himself in harmony with the laws of the organization, he should not ask to be created one of them; and if created one and proves false to its requirements, he should not be continued as one. A member of any organization attempting in some irregular way to further his own position at the expense of others engaged in the same work, does that organization harm. No man should expect or demand the co-operation or protection of an organization when he is false to its laws, and betrays the association by violating the very principles on which the success of that organization has depended.

There was a time when the medical profession was held in reverence and respect. Physicians were regarded as men of intelligence, education and honesty of purpose; a profession of deeds and not of words. Then their virtues and capabilities were not displayed before the people in a spectacular way and service was rendered in a modest, dignified and honest manner. No confusion was created in the minds of the people as to what school they belonged to, who their friends were, nor what their specialty was. They were the medical advisors, and all were satisfied. But today the more confusion we can create, the more attention we can attract to ourselves, the more we can succeed in keeping our names before the public legitimately or otherwise, the more we expect in return.

We have fought members of other schools and advertised ourselves in various ways until the heretofore tranquil mind of the people has become disturbed. Doubting and suspicious, they are beginning to consider the profession a business or a trade, and that the same grasping, wrangling and deceptive methods are being resorted to as in other business avocations.

They realize that their health and body and confidence is being juggled with by the overzealous, designing and incompetent member of the profession who camouflages himself with the title of a physician and plays upon the minds of the unsuspecting public. What are its results? That we have progressed scientifically there can be no question. We know more about the human body and treatment of disease than formerly, but have we maintained our position in the respect of the public; has not our confusion and a tendency to display our self-estimated ability and importance served to confuse the people and drive them from the legitimate channel of medicine and cause them to seek relief from the near professionals? There is no place where it is so easy to impose upon the minds of the people as upon those who are sick and distressed. They are easily influenced and incapable of discriminating between the true and false, and when they see the testimonials of the christian scientist, the osteopath, the chiropractor, and your name, all appearing in the same paper with the same objects in view, what more can you expect than that the people who cannot make distinction would lose respect for one class, and form an attachment for another.

Their advertising looks as good to the people as yours, and while they may display more ignorance in their testimonials, the object of your egotistical and misleading personal reports is just as apparent and destructive to the code of ethics as theirs.

Mercantile advertising has always been accepted as legitimate. In that case they have something tangible to dispose of. A merchant may have a specially fine line of goods, or he may have shelf worn, second hand, or a smoke damaged stock, but he acquaints his patrons through the medium of the press with what he has. You can go examine his goods, take your choice and pay the price. But what have you to

advertise? Have you the audacity to advertise your ability as superior? It may be imaginary only. Have you second hand service to render? Or do you mean to say that you are a little smarter and more capable of doing all things than anyone else in your community? Professional advertising places you on a lower par than the merchant. He can display the goods he advertises, but you cannot. You can only display the man.

What is advertising? It is a method of bringing yourself or your product before the people for personal gain, in which you expect to dispose of something for which you get more in return than you give. It matters not whether you resort to the methods of the street corner vender, the local advertiser, or patent medicine man—you are all in the same class, a disgrace to the profession and false to the honors that have been conferred upon you. You are imposing upon the minds of an ignorant public under the protection of the medical association which fathers you, and the sooner we eliminate you from our societies, the better it will be for us.

If I were to ask you this question, "Shall we advertise?" I have no doubt what your answer would be. Not one of you would advocate going into the papers and conducting a paid advertisement along with the merchant or the patent medicine man, but do you advertise? There are many methods that can be resorted to. You can be spectacular in everything you do. You can attempt to play the churches, local clubs and societies. You may try to subsidize the telephone girls or report your day's business to the daily press, and put your name in a prominent position in connection with cases you come in contact with. You may report the number of cases that come to your office for treatment in a day's time or within the year; or you can secure the services of a staff correspondent and pay for an article in a monthly magazine. It matters not what your method, it's all advertising.

One man has said to me, "They all do it"; another said, "The higher-ups do it, why should not we?" I deny the charge. First, they do not all do it. There is still some honor in the medical profession. Second, the higher-ups do not advertise to the public. They may lecture at medical conventions, or send out printed articles to physicians only, and not the laity, on some particular subject that they are specializing in. This is in the line of education and is legitimate. If a physician has had the advantage of doing research work, or clinical advantages, and has developed a new line of surgical or medical treatment that has yielded more than ordinary results, it is his duty to make it known to the profession by reading a paper or demonstrating the results of his discovery to a recognized medical society. Every man should strive to give as much to the profession that he represents as he gets out of it. This is presenting methods, but not advertising the man. But the little fellow—the fellow who has no special ability, and nothing to offer—the one who has not the patience to sit down and render honest service in a professional way until he establishes himself among his brother practitioners as one who has ability, but resorts to irregular methods of getting his name before the people, is the one who does the harm. If a physician has special ability along certain lines, his brother practitioners are quick to recognize it, and, all things being equal, will call on him for help in time of need. In this way we pay you a compliment. We pay you a compliment in presenting you to our patrons as a man of judgment. This, with your best effort to do good service and an honest desire to render the best within you, should be your only advertisement.

But you say, "The higher-ups do it, and why should not we?" Is this true? I have tried to show the difference between a man parading himself before the public and a clinician imparting knowledge. The Mayo Clinic is perhaps one of the best known and most popular medical organizations in the country. They have been well advertised, it is true. I have heard them accused of doing it themselves. I do not believe it is so. We have done that for them. We have sent them our difficult cases who are examined by their able corps of physicians, a diagnosis made if possible, and treatment is instituted according to their plan; uninfluenced by the patient's grandmother or aunt, social or domestic handicaps such as we have to contend with at home. While we have as good physicians and surgeons all over the country as they are, yet they get results because of their methods and we have heralded their names broadcast until they have become household property and everybody knows the road to Rochester, but the medical profession has advertised them.

The daily press is supposed to be the moulder of public opinion. Newspapers are often hard pressed for news, and will publish any news items without considering the importance or effect. Especially is this true of the small local paper of the rural district. Any physician constantly reporting his cases to these papers with his name prominently mentioned in every instance, does it for personal gain of course, and he is a liability to the profession. These articles are not general news articles. They are of interest to three classes of people—first, the physician who writes them, or permits them to be written, because he likes to see his name in print; second, the unthinking class who marvel and wonder at the volume of business you would have them think you are doing; and third, the

thinking people who see the unfairness of your intentions and accept them only with disgust. But what is the effect in general of this kind of medical propaganda? If it is permitted to continue, the devil will be to pay.

One of the clearest articles on this subject appeared in the January number of THE JOURNAL OF THE INDIANA STATE MEDICAL ASSOCIATION. It is worth being reproduced and says: "A newspaper clipping bureau furnishes THE JOURNAL with clippings or abstracts of personal news and articles of a medical nature from practically every newspaper in Indiana. Very naturally we are amused and at times provoked to note the frequency with which some Indiana medical men, a few of them prominent and a limited number being officers of medical societies, permit their names to appear in the daily papers, often in repetition, concerning cases in which more or less so-called wonderful cures have been accomplished. In practically every instance the 'write up' gives indication of having either been written or inspired by the doctor whose name is mentioned. Lately THE JOURNAL office has been flooded with newspaper clippings, and even letters calling attention to the most flagrant abuse of ethics by certain members of our Association who seemingly court newspaper advertising and notoriety. It is conceivable that occasionally a doctor's name may appear in print in connection with a news note concerning some patient who has been given attention and the publicity occurs without the knowledge or consent of the doctor connected with the case, but such instances are rare, and such newspaper articles do not contain accounts of rare operations told in technical terms nor refer to wonderful or miraculous cures. Furthermore, the average newspaper does not publish these glowing tributes without knowing that they will acceptable. In fact newspapers are quite willing to conform to the wishes of the medical profession that advertising of such character be eliminated. The fact of the matter is that this unethical newspaper advertising and cheap notoriety, if not sought, is sanctioned by some Indiana doctors, and it is time that our local medical societies call for an accounting. We fully realize that the rules of medical ethics are broken often by many of our medical men, and when we attempt the 'cleaning up' process we ought to touch many subjects, but we might begin on newspaper advertising, which is the most flagrant abuse of all at the present time. We again suggest, as we have suggested once before, that county medical society secretaries keep a scrap book and paste in it all the newspaper clippings concerning members which appear to be an abuse of medical ethics and ask the offending members for an explanation. If any guilty doctor refuses to explain or to show that he has been the victim of the kind of publicity of which we complain, without his knowledge or consent, then it is time to ask for his resignation from any reputable medical society and list him among the quacks where he belongs."

I realize how difficult it is to control this destructive tendency and there is no better place to enter a protest against it than in the county medical society. If we are going to continue to exist as a profession, we must suppress those who are traitors to our cause; or if we are going to surrender our principles and deliver ourselves over to an organization of medical brokers, let us throw down the bars, remove all restrictions and admit all who come, regardless of their loyalty.

Let us play the game fairly.

CAUSE AND RELIEF OF ACUTE INTESTINAL OBSTRUCTIONS

Charles H. Mayo, Rochester, Minn. (*Journal A. M. A.*, July 15, 1922), states that the high mortality attending ileus is lowered by early diagnosis, judgment and prompt action when the condition is relievable. Obstruction is due to the various types of hernia. The intraabdominal ileus is due to bands, volvulus and openings in the mesentery or in the diaphragm, serious because of difficulties of diagnosis. Obstruction just below the duodenum causes alkalosis with tetany. Obstruction lower in the tract is manifested by vomiting of foul fluids. Prompt surgical relief of high obstruction is discussed. Colonic obstructions are most commonly due to malignancy, diverticulitis or volvulus. Time should not be lost in instituting efforts to make an exact diagnosis of cause, but surgical measures should be instituted at the earliest moment. The dangers of an unnecessary exploration are trivial compared with the grave risks of delay. Operation for relief of obstruction should be limited to a life-saving procedure, such as colostomy or enterostomy. The nature of the obstruction should be determined at operation, and future procedures should be based on the cause of obstruction. There is difficulty in differentiating diverticulitis from malignancy. Postoperative obstruction too often suffers from delay. The stomach tube is a valuable instrument in cases of obstruction. Early exploration should be made in postoperative obstruction to free adhesions. If exploration is delayed, ileostomy or jejunostomy is indicated. Local anesthesia or combined anesthesia is the method of choice.

EDITORIALS

THE JEKYLL-HYDE ATTITUDE OF THE PUBLIC PRESS CONCERNING MEDICAL PROGRESS AND PUBLIC HEALTH

In a recent number of the *Federation Bulletin* the Secretary of the Texas State Board of Medical Examiners presents a very interesting article, which we herewith reproduce in part, concerning the Jekyll-Hyde attitude of the public press concerning medical progress and public health. It is pointed out that while the press for the most part always has championed the cause of public health, and that it seldom has failed to give enthusiastic support to efforts to promote higher medical education and scientific research, yet there are many newspapers and periodicals, religious as well as secular, that have deliberately played into the hands of the quacks and charlatans and the unscrupulous politicians by accepting from ignorant medical vandals advertisements in which an attempt is made to discredit positive, scientific knowledge, the truth of which has been demonstrated thousands of times.

"If these editors or publishers do not believe that typhoid fever is distributed through the agency of the fly or through infected milk or water; if they do not believe that malaria is transmitted to man through the bite of a mosquito; if they do not believe that yellow fever is transmitted from one person to another by another species of the same pest; if they do not believe that bubonic plague is due to the bite of a flea which has fed on an infected rat or an infected person; if they do not believe that lockjaw and erysipelas are due to infectious organisms which gain entrance to the body with dust or dirt carried into a wound; if they do not believe that gonorrhea and syphilis are the result of direct or indirect contact with an infected person or through soiled linen, drinking cups or some receptacle or utensil used in common; if they do not believe that devastating epidemics of typhoid fever have resulted from sewage contamination of domestic water supplies, then they should have the courage to express their convictions and to insist that city, county, state and the national government shall abandon the existing very expensive but wholly unnecessary health departments, and thus save millions and millions of dollars to an already overburdened people.

"If, on the other hand, they do believe that these diseases are communicable and that as a result of failure on the part of ignorant, incompetent practitioners to so recognize them, or of indifference or inefficiency in the administration of health regulations thousands of lives have been needlessly sacrificed annually, then these newspaper editors and publishers are traitors—aye, Judases—to the communities which they serve, and which are supporting them, else they would not jeopardize the health or the lives of their patrons who always look to them for dependable direction in matters pertaining to the general welfare by publishing and spreading broadcast propaganda in which ignorant criminals (for most of the advertisers are practicing in violation of the criminal laws) set at naught the indisputable facts of medical science and assert that all diseases are due to subluxation of a spinal vertebra, to a distorted spinal foramen or to a pinched nerve, and that they may be easily and speedily cured by a simple thrust, a twist or a punch delivered on the spine of the sufferer by a miracle-working chiropractor or some other equally ignorant knave.

"There may be a few editors or publishers who are so densely ignorant—though none of them would admit it—that they do not know that the causative factor of malaria, the plasmodium, in the field of a microscope is as demonstrable as a fly on the back of an editor's hand; that with the aid of the lens the bacillus of typhoid is just as discernable as a boll-weevil is with the unaided eye; that the treponema of syphilis is as perceptible with the aid of a microscope as a flea on a dog's back; that the coffee-bean-shaped coccus of gonorrhœa is just as real as a chicken mite, or that the bacillus of tuberculosis is just as positive an entity as is that of its human host. But their ignorance of these demonstrable disease-producing organisms cannot negative the fact of their existence nor rob them of their dreadful potency.

"These editors and publishers may or may not know that the pathologies of such diseases as arthritis, rheumatism, pernicious anemia, leukemia, Addison's disease, Bright's disease, paralysis agitans, pellagra, diabetes, hypertension, cancer, and other chronic, incurable diseases, from the victims of which—through the publication of fraudulently intended misrepresentations concerning their causes and his ability to cure them—the medical impostor reaps a golden harvest, are just as positively demonstrable by a skilled pathologist as any other facts of science. But it is not the fault of scientific

medicine that neither the publisher nor his side partner, the medical mountebank, are not aware of this. They probably are equally ignorant of the physics of the gas engine, the steam locomotive, or the radio. But what would happen to them if they attempted to discredit the laws of physics?

"Frequently in the last three or four years the newspapers have made vigorous appeals for financial aid or for food or clothing for the starving Russians, the down-trodden Armenians, or for the French waifs who were orphaned and left unprovided for by the world war. They should know that there are thousands of men, women and children in their own country who are far more wretched than the Russians, the Armenians or the French waifs, since the latter could be made supremely happy by providing them with shelter, clothing, and a liberal supply of wholesome food, while the former—hopelessly incurable—must drag wearily, painfully on in the darkness of despond to the "Valley of Death", constantly scanning the horizon for the dawning of a new day—for a day which may bring them promise of relief from ceaseless torture. These are the pitiable, helpless creatures to whom the luring advertisements of human vultures offer a ray of hope—a phantom oasis in the desert of their wretchedness.

"It is possible that these publishers do not know what the fiendish impostors know only too well—that the victims of cancer, Bright's disease, tuberculosis, diabetes, pernicious anemia and other chronic, incurable diseases grasp at the promises made in such advertisements as a drowning person grasps at straws; and that in consciously aiding or abetting ignorant pretenders to take advantage of credulity in order to perpetrate such frauds they are equally guilty of dishonest action, and that they should be held criminally responsible for it notwithstanding the legality of their advertising practices?

"One might admire the daring of a bandit who goes out on the highway at midnight to pull off a hold-up, in the execution of which he must risk his liberty and possibly his life. Such a person is a prince in contrast with the unscrupulous medical vandal who would take the last farthing from the pocket of an unfortunate, credulous human on the promise of effecting the cure of an incurable malady; and we might respect the highwayman quite as much as we respect a publisher who, conscious of the misleading, fraudulent statements contained in a medical advertisement—but knowing that he is within the law in publishing it, accepts it as a source of revenue. We have little respect for a man, be he preacher, prophet or publisher, who accepts tribute and bread from an indulgent, confiding public with one hand while preparing a poison potion for it with the other. 'It is a mean dog that bites the hand which feeds it.'

"Contemplate the insolence of a medical impostor in taking a widow's mite for sitting at the bedside of a dying child, thrusting at its spine in a pretended effort to readjust a subluxated vertebra—which is an impossibility except in a fracture—while the little innocent is steadily cyanosing as the result of laryngeal diphtheria. An anxious mother—recently widowed by pneumonia via the chiropractic route—is standing by, alternately wringing her hands and wiping away her tears and, between the stridulous, rasping, respiratory efforts of her strangling infant, crying out piteously, 'Doctor (?), for God's sake, doctor; can't something be done to save my baby?' Antitoxin, which would have averted this painful scene, intubation and tracheotomy, either of which—as a last resort—might have saved the little darling, were meaningless terms to this benighted hypocrite, and, after a few more of his useless thrusts and a few more gasping efforts on the little sufferer to get oxygen into her lungs, the struggle ceased, the little eyelids closed and the idol of a mother's heart lay cold and still in death—a victim of commercial greed plus medical incompetency.

"To whom should this tragedy be charged? Should it be charged to the monster who ignorantly or, knowing that other and more effectual treatment than he could give was available, deliberately permitted a helpless infant to strangle to death or should it be charged to the publisher by whom, through a flaming advertisement in the Sunday-morning issue of his paper, the unsuspecting, simple-minded mother of this child was duped into placing her seriously-sick baby in incompetent hands? We leave it to you and to the conscience of the publisher to answer."

"UNDERWEIGHT" A DELUSION

Is there but one normal, healthy standard weight corresponding to every height, so that he who exceeds it is "overweight" and he who falls below it "underweight"? That this idea is a dangerous fallacy is contended by Charles K. Taylor, of the Carteret Academy at South Orange, N. J., writing in *The Outlook* (New York) on "The Great Underweight Delusion." According to Mr. Taylor, a "stocky" boy, or a slender one, may be just as normal and healthy as one who has the "standard" proportions of the Apollo Belvedere. They are of different types, that is all. Some people are doubtless too fat and others too thin, but that fact is to be ascertained, not solely by comparing weight with the height, but by a system of measurements taking both these figures into account.

Mr. Taylor has worked for years to construct a system of tables for this purpose, and thinks he has now a satisfactory method of applying his ideas in practice. He writes:

"Children are frequently slender because it happens to be a hereditary type just as it is hereditary for some to be stockier and heavier than the average. Some races are typically slender, with weight below the general average of humans.

"The very essence of our delusion is the claim that there is only one normal and healthy type of build—the 'average'—and if children (not to mention adults) happen to be more slender than this highly worshipful average, then, obviously, *obviously!* something is wrong with them. They are *underweight!* A frightful term that sends whole communities into providing fattening diets for perfectly healthy children and doing everything that uncanny genius will suggest to make a lot of normal children morbid over matters they do not need to worry about.

"It might be interesting for some one to analyze the Worship of the Average. I don't know what we would do without it! Why, our whole educational system is based upon it! The *average* child! And that is why, though the duller-than-average child is perhaps prodded up a little, children brighter than average are caught fast in the machine, so that educationally they are rarely able to come anywhere near their capacities.

"So when we insist that children should at least come up to an average in weight we are doing only what we also do in the classroom, with this difference, however: When a child's weight is over-average, then we are likely to smile with approval: but when a child is mentally over-average, well, we just let that child remain in the grip of the machine that keeps achievement down to the average scale of things.

"Our stand is simply this—that it is just as normal and healthy for some children to be more slender than the average and for others to be stocky or thickset, as for still others to approximate the average, that it is a matter of inherited type of build, and all we need to do is to see that a child is properly developed for his or her normal type of build.

"When a child is in good physical condition, and particularly when that child's muscles are not flabby, but firm and efficient, then we may be sure that the child's weight is correct, *no matter what it is.* And our work, then, is merely to see that a child has a physical development corresponding to his or her type of build.

"It will take a very serious mental upheaval to bring many of us to see that the question is health and development, and not one of weight, but we are coming to it little by little. And once this is accepted, then another question will come promptly into being. Here is this one: 'How are you going to know when a child is well developed?' Nor is this going to be difficult to answer."

Mr. Taylor's plan is to prepare, from an actual study of healthy children of various heights and weights, tables on what he calls "a height-weight basis." Instead of requiring one particular weight for a given height, these tables give bodily measurements corresponding with various weights, running from the slender type to the "stocky" and the "thick-set." By comparison with these it is easy to see whether the boy is normally developed for his particular height and weight. He adds:

"Our standpoint is based on an intensive study of some thousands of children over quite a number of years. If a child is healthy, and is not one of those typically 'fat' children, then the child's weight is correct, no matter what it is."—*The Literary Digest*, May 6.

PROSTITUTING THE CHURCH IN THE INTERESTS OF QUACKERY

A few weeks ago the chiropractors exploited their cult and inconsistent form of treatment, and it is said even the pulpit was utilized for the exhibition of "adjustments", in one of the Methodist churches at Elkhart. Following close upon the heels of this came blatant newspaper announcements by the chiropractors to the effect that a similar performance would be given in one of the Methodist churches in Fort Wayne. It so happens that a number of representative regular physicians are members of that church and they protested concerning the desecration of the church by any such proceeding, and a protest also was filed by several of the societies affiliated with the church, to say nothing of many protests from individual members. However, those responsible for the renting of the church had cast the die and they begged off on the spurious plea that a contract had been made and must be fulfilled. Accordingly the exploitation of the chiropractic cult in the First Methodist Church of Fort Wayne was carried through in full accordance with the announcements contained in the daily newspapers, and in direct opposition to the wishes of a very large representation of the membership of the church. The strange feature about the action is the fact that prior to this episode the church could not be obtained for any purpose not directly religious in character, even such an innocent entertainment as a concert providing an admission fee was charged, yet in the instance under discussion a rule of the church was broken and a good sized rental fee was accepted.

It is a well known fact that some of the worst frauds are covered by the cloak of religion and the sanctity of the church. Ministers as a class proverbially are known as supporters, usually innocently, of quackery, and oftentimes the rankest forms of commercial deception and fraud. The patent medicine evil in its palmiest days owed its success very largely to the endorsement of ministers and to the effect secured by advertising in religious papers. When practically all other newspapers and periodicals had barred from their pages patent medicine and quack doctor advertisements. the religious press still continued to carry such advertising with shameless disregard for decency or honesty.

A few months ago we published in THE

JOURNAL an editorial entitled "The Doctor's Relation to the Church", in which we pointed out that the principal reason why doctors do not identify themselves more often with churches is because they not only see so much hypocrisy, deception and dishonesty within the church walls, but no effort is made to correct the evils that exist. We are fully cognizant of the fact that hypocrites will get in the church in spite of all that is done to keep them out, and that oftentimes the church will be made a cloak for shady transactions, but this ought to be limited to the individual members of the church and not to the church as a whole. The church stands or should stand for the highest ideals of life, and should be unswerving in its devotion to moral principles. The only reason why a church ever deviates from the path of rectitude is because its leader either is not sincere and has a "screw loose" in his ethical make-up or he hasn't the moral backbone to stand up for what he knows to be right.

In the case under consideration the pastor of the First Methodist Church of Fort Wayne should have been true to his calling and to the Church he represents and said to the Board of Trustees or those responsible for renting the church for other than religious purposes, "Gentlemen, the church over which I preside is for religious purposes and must not be desecrated knowingly, or its motives questioned. No matter what it costs you in financial loss or embarrassment, the ideals of the Church must be preserved and the church not prostituted for commercial ends." Had he taken this stand and refused to have anything more to do with the church if it deviated from the path of rectitude he would have had the support of probably a majority of the membership of his church, and he would have had the satisfaction of living up to the high ideals of the Church.

Wholly aside from the question of the merits of chiropractic which is unscientific, inconsistent, and based upon the rankest ignorance of the cause and effect of disease to say nothing of being practiced for the most part by men and women with not even ordinary education, the attitude of the church should be one of indifference to it or the teachings and practices of any other medical sect. The Church, Methodist or any other, should stand for the highest ideals, and at all times for truth and honesty. Under no circumstances should it endorse openly or by inference *any* school of medicine, and opening the doors of the church to a pseudo-medical cult which represents a lack of education, training and experience for the care of human ills, and the practicing members of which, in the State of Indiana, are law breakers, is a blot upon the Church, to say nothing of being an insult to the members of the Church, especially the medical men who have a right to expect something better.

The First Methodist Church of Fort Wayne did itself irreparable damage and lowered itself in the estimation of many thinking people when it permitted the chiropractors to desecrate the church by a lecture extolling the virtues of chiropractic, and the whole proceeding, tinctured with commercialism from beginning to end, has been nauseating to many members of the Church as well as many on the outside. A great principle was at stake, and the Church sacrificed its honor and its standing rather than defend that principle. The Church needs the respect and confidence not only of its own members but those on the outside, and it loses all this when it stoops to such an incident as the one to which we refer.

UNETHICAL NEWSPAPER ADVERTISING

As the readers of THE JOURNAL know, we have had considerable to say editorially concerning the tendency of some doctors to seek newspaper notoriety by permitting their names to be published in connection with the medical or surgical treatment of cases. These editorial comments have been inspired by complaints from various portions of the State as to the unethical conduct of certain physicians who persist in using the newspapers to further their own ends. Within the last few months dozens of newspaper clippings have been received at the office of THE JOURNAL in which a certain doctor, president of his county medical society, has been exploited in connection with his medical or surgical attention to cases. Very naturally the local medical profession has not looked with favor upon such unethical conduct, and the editor of THE JOURNAL wrote the offending doctor a letter, suggesting that, as president of his county medical society, it was not only unethical but in rather bad taste to continue to exploit himself in the daily newspapers and by so doing put himself on a par with the advertising quack and charlatan. The aforesaid doctor wrote back with the specious argument that he was no worse than the Mayos and those connected with the Long Hospital at Indianapolis, both of whom were his worst competitors in securing "business", but that objection to his practice of giving items to the newspapers would meet with improvement on his part. It was pointed out to him that neither the Mayos nor those connected with the Long Hospital in Indianapolis would take the trouble to furnish items concerning themselves for publication in some distant paper and that, in all probability, they would make every endeavor to suppress such publicity. On the other hand it was pointed out that whenever the doctor's name

appears regularly in local newspapers in his vicinity it is a sure bet that he has been responsible for the information obtained by the newspapers and courts the publicity given. It also was pointed out that this sort of publicity could be checked and not only make a better impression upon medical confreres in the vicinity but upon the public as well. The correspondence evidently was not considered private, in proof of which a newspaper clipping concerning the matter is herewith reproduced from the *Elwood Call-Leader* of Thursday, June 1:

DR. BULSON BUTTS IN

Editor of Medical Journal Would Suppress Newspaper Items.

Dr. Albert E. Bulson, Jr., editor of the Journal of the Indiana State Medical Association, is desirous of having the physicians of the state keep from the newspapers any report of cases of illness and of operations performed wherein the name of the physician is mentioned, saying that it is "unethical."

It appears that there are some persons in Elwood who have possibly been envious at the mention of some of the physicians' names in the newspapers, appearing in the papers frequently, who have written Dr. Bulson saying that the code is being violated by this "advertising" and the doctor takes the matter up with the local physicians.

The physician who gives the newspaper reporter information that is of interest to the readers is entitled to have his name connected with the case or have it omitted as he sees fit. Unless the request is made not to use it the name will appear, and if it is classed as advertising all well and good. The order of things has changed with the passing of time and there are progressive physicians nowadays as well as fogies.

It is very evident, judging from what has transpired, that the doctor in question does court newspaper publicity and that he has no intention of mending his ways or courting the respect of his confreres. In his letter to the editor of THE JOURNAL he asks for a copy of our code of ethics, which he facetiously calls "the code of essecks", or a quotation of the section referring to publicity. We herewith comply with the request:

"Solicitation of patients by physicians as individuals, or collectively in groups by whatsoever name these be called, or by institutions or organizations, whether by circulars or advertisements, or by personal communications, is unprofessional. That does not prohibit ethical institutions from a legitimate advertisement of location, physical surroundings and special class—if any—of patients accommodated. It is equally unprofessional to procure patients by indirection through solicitors or agents of any kind, or by indirect advertisement, or by furnishing or inspiring newspaper or magazine comments concerning cases in which the physician has been or is concerned. All other self-laudations defy the traditions and lower the tone of any profession, and so are intolerable. The most worthy and effective advertisement possible, even for a young physician, and especially with his brother physicians, is the establishment of a well-merited reputation for professional ability and fidelity. This cannot be forced, but must be the outcome of character and conduct. The publication or circulation of ordinary simple business cards, being a matter of personal taste or local custom, and sometimes of convenience, is not per se improper. As implied, it is unprofessional to disregard local customs and offend recognized ideals in publishing or circulating such cards.

"It is unprofessional to promote radical cures; to boast of cures and secret methods of treatment or remedies; to exhibit certificates of skill or of success in the treatment of diseases; or to employ any methods to gain the attention of the public for the purpose of obtaining patients."

We have no desire to enter into local medical squabbles of any sort, but the Indiana State Medical Association stands for certain principles and a conduct on the part of its members which is above reasonable reproach. If the president of one of the component societies of the Indiana State Medical Association sees fit to break a leading rule of professional ethics and ordinary decency and then brazenly defies his confreres who attempt to influence him in reforming his ways for his own interest as well as for the interests of the profession, it is time for some action on the part of a medical society which will tend to purge itself of such conduct on the part of one of its members, and in this case, THE JOURNAL'S good intentions having been abused, there is ample reason for the stand herewith taken.

EDITORIAL NOTES

DEAR DOCTOR:

THE JOURNAL and the Cooperative Medical Advertising Bureau of Chicago maintain a Service Department to answer inquiries from you about pharmaceuticals, surgical instruments and other manufactured products, such as soaps, clothing, automobiles, etc., which you may need in your home, office, sanitarium or hospital.

We invite and urge you to use this Service.

It is absolutely FREE to you.

The Cooperative Bureau is equipped with catalogues and price lists of manufacturers, and can supply you information by return mail.

Perhaps you want a certain kind of instrument which is not advertised in THE JOURNAL, and do not know where to secure it; or do not know where to obtain some automobile supplies you need. This Service Bureau will give you the information.

Whenever possible, the goods will be advertised in our pages: but if they are not, we urge you to ask THE JOURNAL about them, or write direct to the Cooperative Medical Advertising Bureau, 535 N. Dearborn St., Chicago, Illinois.

We want THE JOURNAL to serve YOU.

THE typhoid season is here. How many doctors are remembering the value of typhoid vaccination and advocating it to those who are going to tour and camp in places where water and food supplies are liable to be contaminated?

PROHIBITION has done much to stimulate the consumption of confectionery and soft drinks. The desire for a stimulant to take the place of alcoholic beverages has been met by the manufacture of about fifty-seven varieties of soft drinks containing caffeine, and it is said that the sales of one well known stimulating soft drink have been almost quadrupled since the

Volstead Act became operative. That some of these caffeine-tinctured soft drinks are positively injurious as a result of the stimulating effect and habit formed for increasing amounts cannot be doubted. Perhaps in the end we will find even more stimulating soft drink addicts and deleterious effects therefrom than we ever had from alcoholic beverages.

RECENTLY there has been much agitation concerning the necessity of having sufficient vitamins in our diet, and certain manufacturers—taking advantage of this fact—have been advertising extensively the vitamin value of certain manufactured products sold at enormous profit. It would be well for physicians to tell their patients that it is unnecessary to buy these proprietary preparations in order to secure an adequate amount of vitamins for the diet. Nutritional studies indicate that fruits and vegetables contain a sufficient amount of vitamins, and too much stress cannot be laid on the importance of taking a generous amount of fruits and vegetables, and this is necessary to offset the acid character of minerals found in meat, cereals and eggs.

THE President of our State Medical Association was a little slow in making his committee appointments, and we are under the impression that he procrastinated because he thought that most of the committees do not functionate anyway and that a late appointment is just as good as an early one. In this he is quite right. In fact we are in favor of abolishing all committees except those that show some signs of life. It is the height of absurdity to appoint three or five doctors on a committee, and at the eleventh hour have a committee report based on no actual work of the committee, prepared hurriedly by the chairman, and presented at the annual session of the Association. The fewer and the smaller the committees the better, but let us do away with committees that do not functionate.

ONE of the unfortunate situations produced by the present numerous perplexing medical laws is that of the inability of some of the ablest men in the profession to secure legalization in states which made graduation from a Class A medical college, A. M. A. rating, the statutory qualification for license—either by examination or through reciprocity. This requirement defeats the purpose for which reciprocity was intended and for which this Federation was said to have been organized, and it has built a stone wall around good men of all schools of practice, many of whom are superior in mentality and in medical ability to the men who proposed the laws which limited their sphere of usefulness. I know of no good reason why educated, ethical physicians who graduated from the best colleges we had twenty-five years ago and who have since been in continuous reputable practice should be barred from the privilege of the license in any state of the Union.—T. J. Crowe, Dallas, Texas, *Federation Bulletin,* June, 1922.

IN a recent paper, "Postoperative Pulmonary Complications", published in *Current Researches in Anesthesia and Analgesia* for March, 1922, Dr. Alma Vedin, anesthetist to the New York Hospital, gives some pertinent recommendations for careful examination before and intelligent care after operations. The author states that in an analysis of 7900 operations there were 120 postoperative complications or 1.51 per cent. The complications consisted of lobar and broncho-pneumonia, acute bronchitis, pleurisy (acute fibrinous, sero-fibrinous and suppurative), and embolism of the pulmonary artery, the exact figures being 63 lobar pneumonia, 20 bronchial, 14 acute bronchitis, 11 pleurisy and 12 of embolism of the pulmonary artery. There were 29 deaths; of the 12 cases of embolism, 10 died. An analysis of these complications following abdominal operations shows that there is a large percentage following upper abdominal as compared with those in the lower abdominal regions. The greater number of complications appeared within 2 days following operation.

VACATIONS are popular with all classes of people. Probably the doctor is the least inclined to take a vacation because he thinks he cannot find an opportunity to get away from his work. However, if he waits for the time when he does not have responsibilities he never will get away. On the other hand, he owes it to himself and to those whom he serves to be refreshed in mind and body, and this can be brought about only through the relaxation and the change resulting from an entire divorce from every-day work. This does not mean that the doctor gets a vacation when he leaves his office for a few hours or a day or two to fish in some nearby lake where he is in constant touch with his home work, but it does mean that he must get far away from his home, with complete change of climate and surroundings, and divorce himself entirely from his work. Two to six weeks in the mountains or at the seashore, or a long automobile trip taken leisurely usually affords the beneficial results that bring about a physical and mental rejuvenation that finds its response in more and better work for the ensuing months.

THE Division of Venereal Diseases of the United States Public Health Service has arranged with several prominent syphilographers and genito-urinary surgeons whereby the advice

and counsel of these authorities is to be made available to general practitioners. The plan is referred to as "Consultation by Correspondence".

The method of utilizing this service is for private practitioners who have under their care any cases of venereal infection which they wish to describe to a specialist and ask for advice in regard to treatment or to the method of procedure in handling the case, to send to the State Board of Health a letter setting forth all of the data which they wish brought to the attention of the proper specialists. These letters will be forwarded to the Public Health Service, who in turn will secure an answer to the communication from the best known specialist on the particular phase of the subject discussed in the communication from the private practitioner. It is believed that this sort of correspondence between private physicians and well known specialists will be of material benefit in many cases. This service is, of course, entirely free of charge.

ALL students at the University of Arizona at Tucson sleep in the open air on sleeping porches. This is obligatory for all those who live on the college grounds, and it has been found advantageous from all points of view, we are told by A. O. Neal, Registrar of the University, in an article contributed to *The Nation's Health*. This Arizona University, Mr. Neal tells us, is unique in many ways. In percentage of growth in the past six years it has exceeded all institutions of higher education except four. The housing of the increasing number of students is a vital problem, and its solution has been the plan in which all students sleep on open-air porches. The experience of twenty years has led the University authorities to believe that it is satisfactory from every point of view. It affords rest and sleep in the open, the benefits of which are shown in the vitality and work of the students. It is not unusual for students to make extraordinary gains in weight and endurance in remarkably short time. Few students are willing to return to indoor sleeping rooms after having had a semester's experience sleeping in the open air. Open air sleeping is adaptable to localities where the climate is not so favorable as in Arizona, and there are many colleges and institutions of learning that could adopt to advantage the open-air sleeping. —Abs. from *Literary Digest*, May 6.

IN a paper read before the Chicago Branch of the American Pharmaceutical Association in January of this year, Dr. A. S. Burdick, of Chicago, gives a review of the manufacture of synthetic medicinal chemicals in America. He calls attention to the fact that before the late war, in spite of the fact that the United States had almost illimitable sources to draw on for raw materials through its coal mines, coke ovens and gas plants, its manufacture of medicinal synthetics was virtually limited to the salicylates, including salicylic acid and its salts, acetylsalicylic acid and salol, and small quantities of saccharan, phenolphthalein, and argyrol, and most of these were made by German-owned corporations. Under the stress of necessity, and responding to the call of the government, a number of American manufacturers undertook the production of the most important synthetic medicinals. The number of those which might really be called indispensable was not as large as might be expected—perhaps there were a dozen all told—and of these all are now being made in the United States. He closes his paper with the following appeal which should receive a response from every physician in the United States. "The achievements of the last few years, of which we are all justly proud, are due largely to the fact that we were forced to cut loose from the apron strings of German science. We found we could walk alone, and some of us now think we might 'grow up'; but there are people in the United States who still believe that only the Germans know how to make dyes and drugs, and that we should return humbly to our former condition of scientific dependence. Such a surrender then—for surrender it will be—means setting back the hands of the clock so far as the progress of American medicine goes. It means that we shall be unable to contribute our proper share to the scientific work of the world during the next generation. It means that medicine will not develop in this country as it will elsewhere in the world, where chemical sciences are recognized as being fundamental to a knowledge of the human body in health and disease and to the maintenance of the public welfare. I appeal to you whose interests are closely allied with those of the chemical manufacturer, for support at this critical time which means so much to the future of this, our common country."

DEATHS

MALINDA M. WHEELER, M.D., died at her home in Noblesville, May 25. She was a graduate of the Beach Medical Institute, Indianapolis, in 1885.

E. L. BROWN, M.D., died at his home in Thorntown, May 15, at the age of seventy-six years. Dr. Brown graduated from the Eclectic Medical College of Cincinnati, in 1879.

CHARLES M. SMETHERS, M.D., of Spiceland, died at his home, May 30, following a long illness. Dr. Smethers was fifty-two years of age. He graduated from the Illinois Medical College, Chicago, in 1903.

MARTIN V. B. NEWCOMER, M.D., of Tipton, died June 13, at the age of eighty-six years. He was graduated from the Medical College of Ohio, Cincinnati, in 1867. Dr. Newcomer was a member of the Tipton County Medical Society, the Indiana State Medical Association and the American Medical Association.

SAMUEL D. HATFIELD, M.D., died June 2, as the result of an accidental gun shot. Dr. Hatfield was forty-one years of age. He graduated from the Louisville Medical College in 1906. Dr. Hatfield was a member of the Howard County Medical Society, the Indiana State Medical Association and the American Medical Association.

NEWS NOTES AND PERSONALS

Anything in the line of physicians' supplies or equipment may be obtained from advertisers in THE JOURNAL OF THE INDIANA STATE MEDICAL ASSOCIATION. Patronize these advertisers, for it means a continuance of their advertising patronage, and the latter means a larger and better Journal for you.

THE Wells County Medical Society met at Bluffton, June 6.

DR. W. B. HURON has been made county health officer for Tipton County.

DR. W. F. CLIPPINGER has been reappointed county physician for Vanderburgh County for another year.

DR. P. C. BERNS, of Linton, has completed a post-graduate course in medicine in Philadelphia.

THE Adams County Medical Society held a meeting at Berne, June 9, in the office of Dr. A. Reusser.

JAMES W. ALDRIDGE, M.D., of Covington was married June 15 to Miss Martha Coffing of the same city.

DR. WALTER MCBETH has moved from Burnettsville to Royal Centre where he will practice medicine.

PROFESSOR HOWARD BISHOP LEWIS has been appointed to the chair of physiology at the University of Michigan.

THE Huntington County Medical Society met June 6, at Huntington. A paper was presented by Dr. E. T. Dippell.

FOUR nurses were graduated from Neuronhurst, Dr. W. B. Fletcher's Sanatorium, Indianapolis, Thursday, June 15.

THE Methodist Hospital of Indianapolis has installed a new $7,000 x-ray machine which carries 285,000 volts of electricity.

DR. LEWIS C. TAYLOR, Springfield, has resigned his position as executive secretary of the state board of medical examiners.

DR. F. H. RILEY of Jamestown has received a federal appointment at the Jewish Hospital at Cincinnati, assuming duties on June 15.

DR. HILDING BERGLUND, of Boston, has been awarded the John White Browne scholarship for research at the Harvard Medical School.

DR. ETHEL M. WATTERS, of San Francisco, has been appointed consultant in the administration of the Sheppard-Towner Maternity Act.

THE Tenth District Medical Society held a meeting June 8, at Valparaiso. A paper was presented by Dr. James H. Stygal, of Indianapolis.

DR. GEORGE F. BEASLEY of Lafayette was injured seriously on June 21 when he fell from a step-ladder to the ground. He is eighty years of age.

THE Henry County Medical Society held its monthly meeting June 13, at Newcastle. A paper was presented by Dr. Bernard Erdman, of Indianapolis.

THE Fountain-Warren Medical Society held its regular meeting at Veedersburg, Thursday, May 30. Dr. F. C. Walker, of Indianapolis, presented a paper.

DR. DEAN METCALF of Fort Wayne is spending six weeks in the East, taking the post-graduate course given annually by the Trudeau School of Tuberculosis.

THE second annual commencement exercises of the St. Joseph's Hospital School for Nurses, Fort Wayne, was held on May 18. Seven nurses received their diplomas.

THE Clark Memorial Hospital, at Jeffersonville, Indiana, was dedicated June 15. The hospital has been provided as a memorial of the county's dead in the world war.

DR. ESPY K. SCHURTZ, of Waterloo, Indiana, is attending a course of instruction on tuberculosis at Saranac Lake. He will be absent from his practice for six weeks.

THE Kosciusko County Medical Society held a meeting at Warsaw, May 30. Dr. H. A. Shaffer, of Rochester, presented a paper on "Medical and Surgical Border Lines."

THE Delaware-Blackford County Medical Society held a meeting at Muncie, June 2. A paper on "Evaluation of Symptoms in Diagnosis" was presented by Dr. O. E. Stern, of Indianapolis.

DR. ROSCOE HYDE, of Hartford City, and Miss Elizabeth Weghorst, of Indianapolis, were married Thursday, June 8. They will make their home on West Washington street, Hartford City.

DR. JAMES M. DINNEN of Fort Wayne has been appointed chief surgeon of the Lake Erie & Western Railroad, with general direction of the medical and sanitary work of the entire road.

DR. M. F. JOHNSON, of Richmond, has been elected president of the Sixth District Medical Society. Dr. R. D. Morrow, of Connersville, was made secretary-treasurer and Dr. Smith, of Newcastle, councilor.

THE Madison County Medical Society held its annual outing at Idlewold Park, near Pendleton, June 20. Dr. John Oliver of Indianapolis presented a paper, the subject of which was "Tuberculosis of the Spine."

DR. O. M. DEARDORFF, formerly of Hagerstown, recently has completed a post-graduate course in surgery at the Chicago Post-Graduate School, and located at Muncie, 243-5 Johnson Block, for the practice of medicine and surgery.

ANNOUNCEMENT is made of an Anesthetists' Congress to be held in Columbus, Ohio, October 30 and 31 and November 1, 1922. The Congress is to be international in character, and promises to be the biggest gathering of its kind ever held.

THE Benton County Medical Society held its regular June meeting at Boswell. Drs. F. S. Crockett and Romberger of Lafayette presented papers. Following the scientific meeting an informal reception was held at the home of Dr. and Mrs. O. M. Flack.

DR. F. M. STACKHOUSE of Kingman has retired from the active practice of medicine on account of disabilities received in an accident a year ago. He has purchased a small newspaper at Plymouth, Ohio, and has taken up the work of editor and publisher.

THE Sixth District Medical Society held its annual convention in Connersville, June 1. Papers were presented by Dr. Schonwald of College Corner; Dr. Smith of Newcastle; Dr. J. F. Bowen of Occident; Dr. Craft of Indianapolis and Dr. Segar of Indianapolis.

DR. ERIC CRULL of the Irene Byron Tuberculosis Hospital, Fort Wayne, and Dr. James Stygall of Indianapolis, medical director of the Indiana Tuberculosis League, motored to Saranac Lake, New York, the first of June to take the six weeks' postgraduate course in tuberculosis.

DR. MORSE HARROD of Fort Wayne was elected president of the National Eclectic Medical Association at their recent meeting held in Indianapolis. Dr. J. E. Holman of Indianapolis was chosen first vice-president and Dr. W. P. Best of Indianapolis, recording secretary.

THE Elkhart County Medical Society held its annual outing at South Shore Inn, Lake Wawasee, June 8. About 125 members and guests were present. The afternoon was spent in games, and dinner was served at six o'clock. Colonel Seth Bullock of South Bend was the speaker of the evening.

THE Muncie Academy of Medicine held a meeting at the Hotel Roberts, Muncie, June 9. Dr. Etta Charles, of Anderson, read a paper on "Gasoxygen Anesthesia", and Dr. Clay Ball, of Muncie, presented a paper on "Ether Anesthesia." A paper on "Local Anesthesia" was presented by Dr. W. C. Moore, of Muncie.

THE second meeting of the Medical Women's International Association will be held at Geneva, Switzerland, September 4 to 17, 1922. Each society of medical women in the world is invited to send one eligible delegate and an additional delegate for every hundred members. Clinics in the different European countries may be visited en route.

THE new Harvard School of Public Health, which will open in September, is offering several fellowships of $1.200 each, for the year 1922-23. Special consideration will be given students working for their doctor's degree. Applications for these fellowships should be made to the secretary, School of Public Health, 240 Longwood Avenue, Boston, not later than August 1.

THE Third International Congress of the History of Medicine will be held in London, July 17 to 22, with Dr. Charles Singer as president. Anyone desiring information concerning the congress should communicate with Dr. J. D. Rolleston, 21 Alexandria Mansions, King's Road, London, S. W. 3. The official delegate from the United States is Lieutenant Colonel Fielding H. Garrison.

DR. HENRY LOWNDES LYNAH, of New York City, died March 31, 1922. Dr. Lynah was well known in the practice of the specialty of bronchoscopy and esophagoscopy. Dr. Lynah was one of the founders of the American Bronchoscopic Society. He was instructor in laryngology and intubation at the University of Bellevue Hospital Medical College and was professor of bronchoscopy and esophagoscopy in the New York Polyclinic.

AT a meeting held June 7 at the Bliss Hotel, Bluffton, the Anti-Tuberculosis Society of Wells County was reorganized. Dr. Eric Crull, of the Irene Byron Tuberculosis Hospital, Fort Wayne, and Mr. Cosper, publicity man for the state organization, were the speakers. Howard Uhlman, Bluffton, was elected president; Mrs. J. F. Decker, vice-president; and Howard Thomas, secretary. They plan to employ an executive secretary for the county work, with a central office in Bluffton.

SIR ALFRED PEARCE GOULD, surgeon, died suddenly in London, April 19. He was dean of the faculty of medicine of the University of London and was lecturer on anatomy at the Westminster Hospital, posts which he resigned on his election as assistant surgeon to the Middlesex Hospital. Dr. Gould was president of the Royal Society of Medicine and of the Roentgen Society. During the war he was active in his post as Officer-in-Charge of the Surgical Division of the Third London General Hospital at Wandsworth. He published the Elements of Surgical Diagnosis and was joint editor of the International Textbook of Surgery.

DR. ALFRED G. LONG, of Cambridge, Mass., has arrived in Indianapolis to become director of the division of bacteriology and pathology of the State Department of Health. He succeeds Dr. William Shimer, who has resigned to become head of bacteriological work at St. Vincent's Hospital.

As an indication that occupational strain is greater in the practice of medicine than in any other occupation, statistics for 1921 show that physicians head the list of suicides. During 1921 86 doctors, 57 judges, 37 bank presidents, 21 clergymen, 10 editors, 7 mayors and 7 members of legislatures took their own lives.

ANNOUNCEMENT has been made of the scope of the new school of public health which will be opened at Harvard University in September. Systematic instruction will be given leading to the degrees of bachelor of public health, master of public health and doctor of public health, while students in the school will be eligible under certain conditions to be candidates for the degree of doctor of philosophy in hygiene or of doctor of medical sciences. The new school will include departments of industrial hygiene and tropical medicine which have hitherto been a part of the Harvard Medical School. Dr. David L. Edsall will serve as dean of both the school of public health and the medical school.

DURING June the following articles have been accepted by the Council on Pharmacy and Chemistry for inclusion in New and Nonofficial Remedies:

Borcherdt Malt Extract Co.:
- Borcherdt's Malt Cod Liver Oil and Phosphorus.

Intra Products Co..
- Ven Sterile Solution Procaine 0.5 Per Cent.
- Ven Sterile Solution Procaine 2.0 Per Cent.
- Ven Sterile Solution Procaine 5.0 Per Cent.

Lederle Antitoxin Laboratories:
- Pituitary Extract-Lederle (Obstetrical).

Pituitary Extract-Lederle (Surgical).

Parke, Davis and Co.:
- Diphtheria Antitoxin piston syringe containers.
- Antitetanic Serum piston syringe containers.
- Antigonococcic Serum 12 Cc. bulbs.
- Antistreptococcic Serum 20 Cc. piston syringe container.
- Antistreptococcic Serum 50 Cc. piston syringe container.
- Anti-Anthrax Serum.
- Antimeningococcic Serum.
- Diphtheria Toxin-Antitoxin Mixture.
- Tuberculin B. F. (Bovine).
- Gonococcus Vaccine 1 Cc. bulbs.
- Gonococcus Vaccine 1 Cc. syringe.
- Gonococcus Vaccine 5 Cc. bulb.
- Gonococcus Vaccine 20 Cc. bulb.
- Erysipelas and Prodigiosus Toxins (Coley) 1 Cc. bulb.
- Erysipelas and Prodigiosus Toxins (Coley) 15 Cc. bulb.

KNOX COUNTY

The Knox County Medical Society held its June meeting at the Y. M. C. A., Vincenes, June 13, and had as its guest Dr. William Engelbach of St. Louis who gave a lantern slide demonstration on the "Diagnosis of the Ductless Gland Disorders." Seventy-five physicians from the surrounding counties of Davies, Gibson, Sullivan, and Lawrence and Wabash, Illinois, beside several from Evansville, were present. Dinner was served by the Ladies' Auxilliary of the Y.

D. H. RICHARDS, Secy.

THE TRUTH ABOUT MEDICINES

NEW AND NONOFFICIAL REMEDIES

POLLEN DIAGNOSTICS-LEDERLE.—Liquids obtained by extracting the dried pollen of plants with a liquid consisting of 67 percent glycerin and 33 percent saturated solution of sodium chlorid. Polen diagnostics-Lederle are marketed in capillary tubes containing 0.01 Cc. of a liquid, representing 100 pollen units. Pollen diagnostics-Lederle are employed in the diagnosis of hay-fever (Pollenosis). (See New and Nonofficial Remedies, 1922, p. 232). The following preparations have been accepted:

Arizona Ash Diagnostic-Lederle: Prepared from the pollen of Arizona ash (*Fraxinus toumeyi*).

Arizona Walnut Diagnostic-Lederle: Prepared from the pollen of Arizona walnut (*Juglans major*).

Black Walnut Diagnostic-Lederle: Prepared from the pollen of black walnut (*Juglans nigra*).

Careless Weed Diagnostic-Lederle: Prepared from the pollen of careless weed (*Amaranthus palmeri*).

Cottonwood Diagnostic-Lederle: Prepared from the pollen of cottonwood (*Populus macdougali*).

June Grass Diagnostic-Lederle: Prepared from the pollen of June grass (*Poa pratensis*).

Ragweed Diagnostic-Lederle: Prepared from the pollen of ragweed (*Ambrosia elatior*).

Red Top Diagnostic-Lederle: Prepared from the pollen of red top (*Agrostis palustris*).

Sage Brush Diagnostic-Lederle: Prepared from the pollen of sage brush (*Artemisia tridentata*).

Shad Scale Diagnostic-Lederle: Prepared from the pollen of shad scale (*Atriplex canescens*).

Sheep Sorel Diagnostic-Lederle: Prepared from the pollen of sheep sorel (*Rumex acetosella*).

Slender Ragweed Diagnostic-Lederle: Prepared from the pollen of slender ragweed (*Franseria tenuifolia*).

Sweet Vernal Grass Diagnostic-Lederle: Prepared from the pollen of sweet vernal grass (*Anthoxanthum odoratum*).

Timothy Diagnostic-Lederle: Prepared from the pollen of timothy (*Phleum pratense*).

Lederle Antitoxin Laboratories, New York.—(*Jour. A. M. A.*, June 10, 1922, p. 1803).

NEUTRAL ACRIFLAVINE-HEYL.—The base of 3:6 diamino-10 methylchloracridine, containing about 1.5 percent of sodium chloride as a stabilizer. The actions, uses and dosage of neutral acriflavine-Heyl are essentially the same as those of acriflavine (see Acriflavine and Proflavine, New and Nonofficial Remedies, 1922, p. 25). Neutral Acriflavine-Heyl is also supplied in the following forms:

Neutral Acriflavine-Heyl Tablets 0.1 Gm.,

Neutral Acriflavine-Heyl Throat Tablets,

Neutral Acriflavine-Heyl "Pro Injections" 0.5 Gm. vials,

Neutral Acriflavine-Heyl "Pro Injections" 1.0 Gm. vials.

National Aniline and Chemical Co., New York.—(*Jour. A. M. A.*, June 17, 1922, p. 1893).

LUMINAL TABLETS ¼ GRAIN.—Each tablet contains luminal, ¼ grain. For a discussion of the actions, uses and dosage of luminal, see New and Nonofficial Remedies, 1922, p. 60.

VEN STERILE SOLUTION PROCAIN 0.5 PERCENT.—Each ampule contains 1 Cc. of a 0.5 percent solution of procain-N. N. R. (New and Nonofficial Remedies, 1922, p. 35). Intra Products Co., Denver.

VEN STERILE SOLUTION PROCAIN 2 PERCENT.—Each ampule contains 2 Cc. of a 2 percent solution of procain-N. N. R. (New and Nonofficial Remedies, 1922, p. 35). Intra Products Co., Denver.

VEN STERILE SOLUTION PROCAIN 2 PERCENT.—Each ampule contains 5 Cc. of a 5 percent solution of procain-N. N. R. (New and Nonofficial Remedies, 1922, p. 35). Intra Products Co., Denver.—(*Jour. A. M. A.*, June 17, 1922, p. 1893).

DIPHTHERIA ANTITOXIN (CONCENTRATED ANTIDIPHTHERIC SERUM GLOBULIN)-P. D. & Co.—Marketed in piston syringe containers, containing, respectively, 1,000, 3,000, 5,000, 10,000 and 20,000 units. Parke, Davis & Co., Detroit.

ANTITETANIC SERUM (SEE NEW AND NONOFFICIAL REMEDIES, 1922, P. 282).—Also marketed in piston syringe containers, containing, respectively, 3,000, 5,000, and 10,000 units. Parke, Davis & Co., Detroit.

ANTIGONOCOCCIC SERUM (SEE NEW AND NONOFFICIAL REMEDIES, 1922, P. 285). Also marketed in bulbs, containing 12 Cc. Parke, Davis & Co., Detroit.

ANTISTREPTOCOCCIC SERUM-P. D. & Co. (SEE NEW AND NONOFFICIAL REMEDIES, 1922, P 289).—Also marketed in piston syringe containers, containing, respectively, 20 Cc. and 50 Cc. Parke, Davis & Co., Detroit.—(*Jour. A. M. A.*, June 17, 1922, p. 1893).

PROPAGANDA FOR REFORM

EVANS' CANCER CURE.—Dr. R. D. Evans of Brandon, Manitoba, sells a "positive cure for cancer". The price is "one hundred dollars in advance"! The victim who parts with $100.00 for this cruel and worthless fake is told to shave a patch about the size of a silver dollar on the crown of the head. The "cure" is applied to this spot. This is for the treatment of internal cancer. "For 'external cancer' the discovery is applied on the spot." From an analysis made in the A. M. A. Chemical Laboratory, it was evident that Evans' Cancer Cure is essentially a mixture of 1 part of a fatty substance (such as lard) and 5 parts of dried ferrous sulphate.—(*Jour. A. M. A.*, June 3, 1922, p. 1739).

MORE MISBRANDED NOSTRUMS.—The following products have been the subject of prosecution by the federal authorities charged with the enforcement of the Food and Drugs Act:

Beil's New Nerve Tablets (Beil Mfg. Co), consisting essentially of aloin, zinc phosphid, nux vomica extractives, resin, a laxative plant drug, magnesium and iron salts.

Diemer's Prescription for Gonorrhea and Gleet

(Dr. F. W. Diemer Medicine Co.), consisting of pills which contain Epsom salt, calcium sulphid, ferrous sulphate and oil of cubebs, and tablets for external use, containing boric acid, zinc sulphate and hydrastin.

Diemer's Dyspepsia Tablets (Dr. F. W. Diemer Medicine Co.), consisting chiefly of baking soda, a laxative drug and ipecac alkaloids.

Diemer's Hot Toddy (Dr. F. W. Diemer Medicine Co.), tablets containing milk sugar, baking soda, a laxative plant drug and small amounts of ginger and red pepper.

Diemer's Kidney and Bladder Tablets (Dr. F. W. Diemer Medicine Co.), consisting chiefly of baking soda, saltpeter and a laxative plant drug.

Diemer's Treatment for Piles (Dr. F. W. Diemer Medicine Co.), suppositories containing cacao butter, borax, alum and tannin-bearing plant material.

Diemer's Antiseptic Female Suppositories (Dr. F. W. Diemer Medicine Co.), suppositories containing borax, alum and tannin-bearing plant material.

Diemer's Rheumatic Remedy (Dr. F. W. Diemer Medicine Co.), containing chiefly acetanilid, baking soda and a laxative plant drug.

Diemer's Pennyroyal and Tansy Compound (Dr. F. W. Diemer Medicine Co.), tablets containing chiefly plant material, including aloes and red pepper, with saltpeter and sand.

Diemer's Preparation for Specific Blood Poison (Dr. F. W. Diemer Medicine Co.), containing, chiefly, calcium carbonate, ferric oxid, potassium iodid and small amounts of arsenic and mercury.

Diemer's Laxative Grip-Malarine (Dr. F. W. Diemer Medicine Co.), consisting of acetanilid, baking soda, aloes and red pepper.

Manhood Tablets (Hollander-Koshland Co.), containing damiana, strychnin and zinc phosphid.

Patten's Lightning Salve (John H. Patten), consisting of camphor, turpentine, soap, resin, tallow, beeswax and petrolatum.—(*Jour. A. M. A.*, June 3, 1922, p. 1740).

SALICYLATES "NATURAL" AND "SYNTHETIC".—The Wm. S. Merrell Company rehashed the definitely refuted claim that "synthetic" salicylic acid is inferior to the "natural" kind. The Merrell Company suggests that, to avoid the effects of synthetic salicylic acid, physicians should specify "natural" and "Merrell" in writing prescriptions for sodium salicylate or any of the other salicylates. About ten years ago, the Council on Pharmacy and Chemistry instituted a thorough investigation of the asserted superiority of natural salicylic acid and salicylates over the ordinary or synthetic kind. This investigation afforded conclusive proof that the claim—based on a mixture of mysticism, commercial exploitation, misinterpretation and tradition—is without foundation. Nevertheless, the Merrell Company attempts to induce the medical profession to perpetuate this exploded fallacy and to specify the Merrell product, which costs twenty-four times as much as the synthetic sodium salicylate of U. S. P. quality.—(*Jour. A. M. A.*, June 3, 1922, p. 1742).

MORE MISBRANDED NOSTRUMS.—The following have been the subject of prosecution by the federal authorities charged with the enforcement of the Food and Drugs Act:

Ammonol Tablets (Ammonol Chemical Co.), containing acetanilid, amonium carbonate, sodium bicarbonate and sodium phosphate.

Johnson's Female Regulator (Logan Pharmacal Co. and the France and New York Medicine Co.), consisting of pills containing extracts of vegetable drugs.

Fosfo-Ferrogen De Johnson, containing caffein and compounds of iron, quinin, strychnin, arsenic and calcium.

Bick's Nerve Tonic (Palestine Drug Co.), consisting of two preparations, one a brown tablet, containing phosphorus, phosphates, zinc and iron and the other a pellet containing phosphate, iron and strychnin.

Vitalo (Allan-Pfeiffer Chemical Co.), containing vegetable extractive matter including damiana, nux vomica, sugar, alcohol and water.—(*Jour. A. M. A.*, June 10, 1922, p. 1832).

THE INTRAVENOUS USE OF ACACIA.—It is now generally accepted that acacia has a limited and uncertain usefulness. The intravenous use of acacia is a recent therapeutic procedure and apparently sufficient time has not elapsed for the thorough appraisal of its use as a therapeutic remedy. Bearing in mind the accidents from the use of acacia that have been reported, the lack of agreement as to its beneficial effects, among surgeons who have tried it, the experimental evidence that has been reported as to its deleterious effects and the paucity of data indicating its clinical usefulness, conservative practitioners will still withhold their verdict. Moreover, the questions of intravenous therapy, which are involved in any discussion on the use of acacia in shock, hemorrhage and allied conditions, are an important and serious complicating consideration.—(*Jour. A. M. A.*, June 17, 1922, p. 1897).

MORE MISBRANDED NOSTRUMS.—The following products have been the subject of prosecution by the federal authorities charged with the enforcement of the Food and Drugs Act:

East India Capsules (Hollander-Koshland Co.), containing sulpharated vegetable oil, copaiba and oils of cinnamon and santal, and claimed to be an effective treatment for gonorrhea.

Zerbst's Cough Sirup (The Zerbst Pharmaceutical Co.), a sirupy liquid containing alcohol, water, sugar, chloroform, licorice and other plant principles, and small amounts of tartar emetic, morphin, hyoscyamin and a magnesium salt.

Cummings' Pill-Mass (F. P. Cummings Co.), containing copaiba, volatile oils, vegetable extractives and a salicylic acid compound and represented as a remedy for gonorrhea, gleet, etc.

Craemer's Calculus Corrective (Wm. Craemer Medicine Co.), an alkaline watery solution, composed essentially of potassium, sodium, ammonium, phosphate, chlorid, citrate, salicylate and a small amount of saccharin and represented as a remedy for gallstones, stones in the kidney, etc.

Salax Compound (Salax Water Co.), consisting chiefly of a mixture of sodium sulphate, baking soda, sodium acid phosphate, with smaller amounts of common salt and washing soda. It was falsely claimed to be derived from Salax water, a mineral water at Excelsior Springs.

K K K So So Se (K K K Medicine Co.), a dark brown water-alcohol solution, consisting chiefly of sugar and glucose with a small amount of creosote, methyl salicylate, red pepper, oil of sassafras and plant principles.

K K K Pectus Balm (K K K Medicine Co.), a water-alcohol solution, consisting chiefly of sugar, small amounts of ammonium chlorid, benzoic acid, tartar emetic, saccharin, bitter plant principles, traces of camphor and oils of anise and eucalyptol.

K K K Tonic (K K K Medicine Co.), a water-alcohol solution containing sugar, small amounts of emodin-bearing (laxative) drugs, bitter plant extractives, pepsin and traces of cinchona alkaloids, hydrochloric acid and oils of cloves and cassia.

K K K Laxative Perio (K K K Medicine Co.), a watery alcohol solution of sugar, sodium phosphate, laxative drugs and small amounts of plant principles, saccharin and oils of orange and anise.

Paradise Oil (California Good Health Co.), consisting of a combination of sulphurated linseed oil and turpentine.

Armour's LABORATORY PRODUCTS

"Why Take a Chance, When You May Be Sure, in Treating Thyroid Insufficiency?"

The most recent method of treating Thyroid Insufficiency is to administer two-grain doses of **Standardized Thyroids** t. i. d. until the usual sumptoms of hyperthyroidism appear; then give small doses, (1-10 or 1-4 grain) to maintain balance.

The Armour Thyroid Preparations are **stable** and dependable. They are standardized for **iodine** content and run uniformly.

The Armour Thyroid Products represent all the therapeutic properties of normal Thyroid glands unimpaired, as all desiccating is done in vacuum ovens at a temperature never above 105 degrees F.

We offer Thyroid Powder and 1-10, 1-4, 1-2, 1 and 2 grain compressed tablets.

TRUTH ABOUT MEDICINES

(Continued from page 250.)

Tarina Carbolized Salve (California Good Health Co.), composed essentially of petrolatum with small amounts of phenol and oil of tar.—(*Jour. A. M. A.*, June 17, 1922, p. 1912).

VITA ZEST NOT ADMITTED TO N. N. R.—The Council on Pharmacy and Chemistry reports that Vita Zest (Vita Zest Co., Inc., New York City,) comes in the form of capsules and is stated to be composed of 83 1/3 percent of "highly concentrated vitamin extracts (Fat Soluble A, Water Soluble B and Water Soluble C)". The amount of material in each capsule is not declared nor is any information offered to show that the amount (or potency) of the three vitamins, the claims advanced for it are such that is determined or controlled. Even if it were shown that the product contains appreciable amounts of vitamins, the claims advanced for it are such that most enthusiastic advocates of the administration of vitamin would scoff at them. The Council declared Vita Zest inadmissible to New and Nonofficial Remedies, because (1) its composition is indefinite; (2) it is exploited under unwarranted therapeutic claims and in a manner which tends to its indiscriminate use, and (3) because the name suggests its haphazard use as a general tonic.—(*Jour. A. M. A.*, June 17, 1922, p. 1912).

LAXATIVES.—Untoward Effects of Laxatives.—Lately a number of instances of cutaneous manifestations due to the use of phenolphthalein as a laxative drug have been brought to the attention of physicians, particularly by dermatologists. Now Underhill and Erico have demonstrated that when magnesium sulphate, sodium sulphate and potassium and sodium tartrate are administered experimentally in doses capable of producing diarrhea, a distinct concentration of the blood may take place. The fact that purgatives exert a definite influence, in the direction of concentrating the blood, indicates that care should be exercised in the administration of purgatives in disease conditions, especially in those conditions known to be responsible for concentrated blood. Blood concentrated to some extent, and yet not sufficiently concentrated to be dangerous in itself, may reach a dangerous concentration by the added influence of the purgative.—(*Jour. A. M. A.*, June 24, 1922, p. 1964).

THE CLINICAL HISTORY OF TUMORS OF THE FACE AND JAWS AS A GUIDE TO THEIR CORRECT DIAGNOSIS AND PROPER TREATMENT*

W. D. GATCH, M.D.

INDIANAPOLIS

In the treatment of a tumor, benign or malignant, of any region it is essential that we have an accurate knowledge of the life history of the lesion. The microscopic picture itself is often misleading. To outline the proper treatment and to give an accurate prognosis the surgeon must know the clinical history of a large number of similar tumors in the same situation and at various periods of life. For example, squamous cell cancers of the lower lip, cervix uteri, of the tongue and of the skin present almost identical microscopic pictures, yet the prognosis is vastly different. Furthermore, as Bloodgood has pointed out, the criteria whereby individual pathologists judge the malignancy of a tumor vary greatly. As a result, the percentage of cures obtained by any surgeon will depend largely upon his pathologist. To illustrate this point, Bloodgood studied the ultimate results in over one hundred and fifty cases of chronic cystic mastitis, a condition often regarded as cancer or potential cancer. In this series, every possible type of operation, from partial excision of the lesion to the radical operation for cancer of the breast had been done. Not a single patient, however, had developed cancer or had died of cancer. It is evident that if this condition is called cancer, the percentage of cures obtained for cancer of the breast will be high. On final analysis, our knowledge of the malignancy of a growth and the results to be expected from various methods of treatment is based upon accumulated clinical experience. The very opinion formed from the study of a microscopic picture should be based upon the same ground—a fact too often ignored. The tendency to regard a given microscopic picture apart from the other facts of the case as a safe guide to prognosis and treatment is productive of much harm. It leads either to unnecessarily mutilating operations or to neglect of operation in curable cases. We should plan our treatment and found our prognosis not alone upon a microscopic section but upon such facts as the situation of the tumor, the rapidity of its growth, the degree of its fixation, and above all, upon known results obtained under nearly identical conditions. A given cancer must be studied, not merely in the light of cancer in general, but in the light of cancer in the particular situation involved. The microscopic study furnishes only one piece, and that often a very unsatisfactory piece, of the entire evidence.

Furthermore, pathologists competent to form a safe opinion from the microscopic examination of a piece of tissue, are by no means common, and an incompetent pathologist is dangerous. Obviously it is not always possible to send a piece of tissue to a distant laboratory for examination, for the diagnosis, to be of use, must often be made while the patient is on the operating table.

From the foregoing consideration it follows that we must have other guidance to diagnosis and treatment than the microscope. This instrument unwisely relied upon is often the cause of disastrous mistakes. This paper is intended to illustrate in a general way, and in a particular field, how such guidance may be obtained—also that it is fairly certain and reliable, and easily to be obtained, by taking a careful history of the origin, duration and growth of the lesion, and by careful observation of its own characteristics.

The face and jaws give origin to a great variety of neoplasms arising from the orbital structures, the skin and mucous membrane, the teeth, the gums and the bones. It is not my purpose to attempt an exhaustive discussion of these tumors. This would require an entire treatise. I shall attempt to illustrate the differential diagnosis and the surgical treatment of these conditions in the light of the facts we have just discussed. For our purpose, the following classification of tumors of the face and jaws will be sufficient:

A. From the skin and mucous membrane arise

(*) Presented before the Section on Surgery of the Indiana State Medical Association, Indianapolis session, September, 1921.

two types of cancer, the squamous celled (carcinoma spino-cellulare) and the basal celled (carcinoma baso-cellulare) or rodent ulcer. Also various nevi, most common of which is the hemangioma, and finally, any tumor of the skin which may occur anywhere.

B. The common tumors of the parotid gland are the mixed tumors, cancer and sarcoma.

C. From the teeth arise the odontomes proper, dentigerous cysts, and adamantine epithelomata.

D. From the gums arise cancer, sarcoma and epulis, as well as benign hypertrophies of the epithelium due to chronic irritation and infection.

E. From the jaw may arise sarcoma, osteoma and bone cyst.

This is not intended to represent a systematic or scientific classification, but merely to serve as a convenient outline to meet the purposes of this paper. The lesions enumerated vary in malignancy from the most rapidly fatal and destructive tumors to those which are perfectly benign. In the differential diagnosis of a given tumor, the condition must first be distinguished from various inflammatory processes such as tuberculosis, syphilis, actinomycosis and pyogenic lesions. This is not always easy, but the scope of this paper limits us to a consideration of the differential diagnosis of members of the neoplastic group among themselves. In a general way it may be said of these non-neoplastic lesions that they display early ulceration or sinus formation in a way not common with tumors, and that they are attended with more constitutional disturbance than the latter.

A. Let us first consider the tumors arising from the skin of the face and the mucosa of the lips, alveolar processes and cheeks. The moles, including the common hemangioma or birthmark will obviously present but little difficulty in diagnosis. If any of these begin to increase in size, to become hard or ulcerate, it is probable that a sarcoma has developed, and such changes should be accepted as a positive indication for their thorough and early extirpation with the knife, or better, the cautery. Cancer arising in this situation differs in history from the moles in that while the latter are commonly congenital, cancer is a lesion which appears later in life. While the moles are obviously sub-epidermal in origin, the cancer, with the rare exception of tumors starting in sweat or sebaceous glands, is epidermal in origin, starting on the skin as an area of roughening or a small area covered with crusts, and on the mucosa as a shallow ulcer with a slightly indurated base. The location of the cancer is of the greatest importance in judging its type and relative malignancy. The old clinical rule that cancer arising above the line of the lower lip is relatively benign, whereas that arising below this level is malignant holds good, and depends upon the fact that cancers in the former situation are nearly always of the basal cell or rodent ulcer type, whereas those arising in the latter situation are nearly always of the squamous cell type. The familiar appearance of the rodent ulcer, with its elevated crater-like border of normal skin, and indurated grayish, encrusted or weeping base, is so characteristic that it can hardly be mistaken for any other condition. The squamous cell cancer of the lip or mouth is practically always an elevated, more or less fungating and friable tumor, which bleeds easily.

The above given, distinct and easily recognized characteristics make the diagnosis of these tumors easy. The microscopic study merely makes a certainty doubly sure. What we have stated concerning accumulated clinical experience, as the only basis for the proper treatment of any tumor, is admirably illustrated in this case.

Basal celled cancer practically never spreads to the regional lymphatic glands. It is essentially a local process and although it may produce the most extreme mutilation of the face, it is nearly always, even in its more advanced stages, curable, either by thorough local removal or by x-ray or radium treatment. That these rodent ulcers be allowed to progress until they have destroyed perhaps the orbital contents and even encroached upon the cranial cavity is a reproach to our civilization. They are best treated in their early stages by radium, which if thoroughly applied will cure them with practically no deformity. However, when they have advanced until the eyeball or the cranial bones are encroached upon, they may require a judicious combination of the knife, the cautery and radium to effect a cure. When the nose is the site of a rodent ulcer of large size, the best treatment is the amputation of the nose with or without rhinoplasty according to circumstances. It is the writer's opinion that these patients attract less attention when they conceal the loss of the nose by a simple black pad than when they have been provided with an artificial nose or undergone a rhinoplasty, no matter how excellent the rhinoplasty.

Squamous celled cancer in my experience does not yield very readily to radium treatment. It requires operative removal of the local lesion together with all lymphatics which may possibly be involved and which are accessible to removal. The great majority of squamous celled cancers of the face occupy the lower lip. In this situation they are readily curable by extirpation carried out in the relatively early stages of the growth. Even when the growth is far advanced, has become fixed to the jaw, the outlook is by no means hopeless, as the case reports

I shall present will show. Squamous celled cancer of the cheek or alveolar process is a much more dangerous lesion than the same type of growth on the lower lip. Still, it is in some cases curable. With these tumors, as with rodent ulcer, it is disgraceful that operation should be postponed until it becomes extremely radical and mutilating. However, the surgeon should bear in mind that no matter how mutilating his operation may be, it will not be as mutilating as the growth itself, let alone. Furthermore, that the extensive operations required do not produce anything like the discomfort to the patient which we might imagine. A discussion of the technique for the removal of advanced carcinoma of the lip, cheek or gum is in order here. In this situation, the general law which holds good for cancer anywhere is that the growth must be widely circumscribed and totally removed together with all its ramifications. To get successful results in these cases, it is necessary to perform the operation totally regardless of the resultant cosmetic effect. Once the lesion has been removed, it is time to study how the appearance and comfort of the patient can be improved. Another principle which must not be lost sight of is that in the course of the operation, cancer cells must not be implanted in the wound. This can be prevented by a preliminary thorough cauterization of the growth. In fact, as has been pointed out by many authorities, many of the bad results have been due to this cause. Another truth to be borne in mind is that the older the patient, the relatively better the prognosis so far as cure of the cancer is concerned. In extremely old people these cancers are rather surprisingly benign in character.

I wish to say a word in regard to the repair of the extensive defects which result from the radical removal of these tumors. It is possible in almost every case by the bringing down of flaps from the upper lip and cheek or up from the neck to close the defect. We should not lose sight, however, of the fact that a pair of lips which present a fairly normal appearance may be functionally almost useless. The mouth is surrounded by a sphincter muscle and the innervation and integrity of this should be preserved. The mouth which is of the greatest functional use to the patient will be one which he can move with the greatest freedom in phonation, and mastication. It has been the writer's experience that these patients may have a better functional result when a portion of the lower jaw has been removed. When this is not done, the extensive scar may contract so as to fix the jaws in an immovable position. While bone-grafting to restore the contour of the jaw may be eminently proper after injuries or in young people, it would seem to have a very limited use in the cases we are considering.

Tumors of the parotid gland are either very benign or very malignant, easily curable or hopeless. The most typical tumor here is the mixed tumor, regarded by some as an endothelioma, which under the microscope shows an extremely complex structure, hyaline material, cartilage, epithelium and fibrous tissue. It has been suggested that this conglomeration of tissues results from an invasion of the fundament of the lower jaw by the developing parotid gland in embryonic life. The mixed tumor forms a growth of extremely long duration, nodular, not attached to surrounding structures, at times reaching an extreme size, but producing symptoms only by pressure or through its weight. The only problem in its removal is the avoidance of the branches of the facial nerve. I have on several occasions, when operating upon early tumors of this kind, shelled out the growth from within its capsule, a procedure which enables one to recognize and avoid the nerve. However, it is not a procedure to be recommended without reservations, because in one of my cases it was followed by a recurrence of the tumor. Sarcoma and cancer of the parotid gland produce a brawny induration and fixation of the skin, extreme pain and facial paralysis. The location of the growth, these features, together with the absence of infection are sufficient to render the diagnosis easy. Operation is out of the question. Radium may be tried.

For the sake of simplicity of treatment let us consider in one group tumors of the gums, teeth and jaws. From these structures arise a remarkable variety of tumors, the differential diagnosis of which may require an x-ray picture in addition to a good clinical history and a careful visual and tactile examination. These means, readily available to everyone, are in nearly every case sufficient to establish the diagnosis.

I have thought that I can present this subject most clearly by means of the following outline:

TUMORS OF THE GUMS

1. The benign epulis—a knobby tumor arising about the teeth—of variable density—slow growth—may loosen the teeth—covered with mucous membrane except when subjected to trauma.

2. Cancer—usually arises in the upper jaw—always somewhat fungating and ulcerated—bleeds easily—spreads rapidly.

3. Chronic ulcer due to ulceration and infection usually on cheek about carious teeth—may resemble cancer but does not spread far from the point of ulceration.

TUMORS OF THE TEETH

1. Odontomes—used in sense of a tumor of a tooth. Hard tumor inside the alveolar process—usually associated with an unerupted tooth—x-ray clears diagnosis.

2. Dentigerous cyst—tumor inside alveolar process of jaw—if large gives parchment-like crackling on palpation. Has fibrous capsule. x-ray usually shows it to contain an unerupted tooth.

3. Adamantine epithelioma — large, slow growing tumor with cysts containing black fluid —may replace entire jaw. Usually in mandible. Rare.

TUMORS OF THE JAW

1. Bone cysts—rare—x-ray shows no tooth inside cyst. Cyst has no fibrous capsule.

2. Sarcoma-periosteal or medullary in origin, of rapid growth. Destroys bone and quickly forms a soft, friable, bleeding mass on reaching the surface.

3. Sarcoma — medullary — giant cell—slow growing relatively limited to medullary cavity of bone. On examination has a gelatinous consistency and a rusty color. Lies in a well defined space in the bone.

We may lay down the following rules as a guide to treatment:

1. The only tumor of this region which requires radical removal is cancer. Such removal is best accomplished with the cautery or perhaps by electro-coagulation. Periosteal or medullary sarcoma is either so terribly malignant that no operation is of avail, or else so benign (medullary giant-cell type) that it is cured by a thorough local removal. (The latter type is quite easily recognizable on exploratory incision. The malignant sarcomas are best treated by radium.

2. The odontomes require only removal—the dentigerous and bone cysts require only opening and curettement with the least possible damage to the jaw. Adamantine epithelioma requires removal of the affected portion of the jaw.

3. Epulis requires only thorough local removal—if it recurs it remains local. The limits of this paper have rendered the above dogmatic presentation of the subject necessary. However, I believe that the facts stated conform to the teaching of our best authorities on surgical pathology. I have arranged them in this manner to support my main contention that evidence obtained from the clinical history and from ordinary gross examination of tumors, viewed in the light of accumulated clinical experience in similar cases, form a safe guide to diagnosis and treatment, and that such evidence is of at least as great scientific value as is that from the study of a microscopic picture. This is not to be interpreted as an effort to belittle the use of the examination of tissue with the microscope. It is instead an effort to make such examination more intelligent and better related to the other evidence in each case.

DISCUSSION

DR. T. C. KENNEDY (Indianapolis): I have had many conversations with Dr. Gatch about the treatment of squamous-cell epithelioma, and while he believes in the efficacy of radium in the basal-cell epithelioma, he is still partial to surgery in the squamous cell type.

A large percentage of the squamous cell epithelioma will yield to radium and every case should be so treated before resorting to surgery. If radium fails, which it rarely does, it is then wise to resort to surgery, but not before.

DR. ALBERT COLE (Indianapolis): We have a good many of these tumors of the face sent to us for diagnosis and I want to state that it is not as easy as Dr. Gatch has implied, at least not in our experience. We are often very much in doubt as to what we have. I remember one case several years ago where we had apparently a bone cyst of the lower jaw. For some reason the patient was put upon specific treatment and the condition cleared up in a short time. We have had others of a similar type.

I am glad to hear Dr. Gatch make the statement he did regarding the pathologists. We are always pleased to know that men in our diagnostic lines of work make mistakes as well as the roentgenologists.

DR. EDWIN N. KIME (Indianapolis): I would like to cite a case which has a bearing upon this idea of microscopical diagnosis. This was a woman, sixty years of age, who for two years had a tender, cauliflower-like mass on the upper jaw. It started behind the median incisor tooth. She was referred to me by one of the dentists in town. I would not attempt to give the history in detail because it would take too long, but all examinations were negative, negative each time for cancer. I made an examination myself and examination was also made by three pathologists. Each of them stated that it was negative, or practically so. It showed merely a hyperplasia of the epithelium of the gum. The only thing that touched that case in the form of treatment was the x-ray, and that seemed to hold it down. It decreased a little in size. The application of the actual cautery helped a little, but the x-ray did the most good. Examination by a nose and throat man revealed there was new granulation tissue in the maxillary air sinuses. The patient went back home, tried treatment by the x-ray, and the last I heard of the case was that the eyeballs began to push out and that she was dying of undoubted carcinoma of the antrum. In that instance our microscopical findings did not help us. They really led us astray. We thought we had a benign tumor when it was really a malignant tumor. However, a negative microscopic diagnosis means that it is negative; it does not have any other value. Just as a negative Wassermann means that you have not determined that the patient has syphilis. I do not feel the microscopical examination was dependable in this case, simply because none of the three sections

were obtained from the heart of the growth, which was primary in the nose or antrum. The surface tumor was in itself benign, being an irritative hyperplasia of the epithelium of the oral mucosa. The association of the first visible manifestation of the growth with the oral end of the anterior palatine foramen should be of some interest from a diagnostic standpoint.

DR. W. U. KENNEDY (Newcastle): It has been my fortune in the past few years to have had considerable experience in these flat-cell malignant growths of the face. I am a firm believer in the use of radium, a believer in the use of the x-ray, but not as a preliminary except in small and very early types of lesion. Whenever there is involvement of substantial structures I believe in early and wide incision, a block resection that eliminates the diseased tissues, and then the application of large doses of radium for a short period, or the intensive application of the x-ray. But we must not lose sight of the permanent necessity of early and wide resection followed by the use of radium or the ray. I believe in this way we will get the greatest percentage of success in our cases.

DR. H. K. BONN (Indianapolis): Since the first of the year I have had two cases of carcinoma of the lower lip, one in a man of 74, the other in a man of 48 years of age. The older gentleman is sure that this growth on his lip has been present for at least five years, while the carcinoma has been present for three years in the case of the younger man.

The man of 74 years of age declined to submit to a block dissection of the neck. There were no palpable glands, hence a wide local removal of the growth was done.

A wide local removal, preceded by a block dissection of the palpable glands of the neck, was done in the case of the man aged 48 years. Radium by Dr. Kennedy was begun a few days after the operation and continued after the patient left the hospital. The patient of 74 years of age declined to permit the use of radium. Both specimens, including the glands of the one case, were examined by two pathologists. The lip specimens showed carcinoma, squamous-cell type, but the removed glands failed to show malignancy and were reported as inflammatory. These two cases may perhaps, in view of the fact of the long residence of the growths, show that there actually exists a degree of variance in carcinoma.

The cosmetic effect, even though the local exesion was carried wide of the edges of the growth, has been satisfactory to both patients, who have declined a further plastic operation.

Hence in some cases, a primary or secondary plastic is not necessary, at least from the patient's standpoint. To date, there has not been a recurrence in either case.

DR. W. D. GATCH (closing): Cancer of the lower lip is easy to cure, compared with cancer in other parts of the body.

I want to emphasize the point of the age of the patient. These growths in people of 70 and 80 are surprisingly benign while they are relatively malignant in younger people.

I do not want Dr. Cole to understand me as saying that the differential diagnosis of these lesions is always easy. The point I want to make is that it is possible to formulate a safe plan of treatment in every case, though in a great majority of cases there are difficulties of exact diagnosis. The operation I have used on these advanced cases of cancer of the lip or cheek is extensive. I think the evidence goes to show that when once cancer has involved the glands the chances for cure are extremely remote.

As to the use of radium. In the advanced cases you have the combined use of surgery and radium. In squamous-cell carcinoma of the mouth I have failed to get very good results from radium, and I still hold to the idea that these should be treated surgically. I believe there is great hope in the so-called electro-coagulation. It is said you can thus excise the whole tongue, bloodlessly, and without danger of spreading the growth.

TREATMENT OF COMPOUND FRACTURES*

E. B. MUMFORD, M.D.
INDIANAPOLIS

Compound fractures have always been considered as more serious lesions than simple fractures on account of the possibility of infection which might lead to an extensive osteomyelitis or to a more grave septicemia. Just what percent of compound fractures have become infected is rather difficult to estimate, as it will vary greatly with the extent of the laceration of the soft parts, the amount of contamination, the environments of the patient and the skill of the surgeon. However, infection has, in the past, occurred so frequently in this type of wound that its possibility dominates the whole treatment of the case.

Before the introduction of antiseptics practically all compound fractures became infected and amputation of the extremity was the usual end result in order to save the life of the patient. Following the introduction of antiseptics since the days of Pasteur and Lister not only have infections become of less frequency, but amputations are rarely done. The basic principles however have not changed, the only variation being in the type of the antiseptic used in the attempt to make and keep the wound clean.

* Presented before the General Meeting of the Indiana State Medical Association, Indianapolis session, September, 1921.

A review of the text books gives almost universally two cardinal principles in the treatment of compound fractures—first, to thoroughly cleanse the wound by irrigation, swabbing, etc., and secondly, to leave in drains to take care of any infection which might occur. Scudder in his edition of 1905 of "Fractures" states that compound fractures should be "treated on the presumption that every open fracture is infected." After outlining a careful preparation of the wound in which irrigating and swabbing of the "moderately enlarged" wound is the first step, he then advocated "leaving the wound open enough to receive several temporary gauze wicks for drainage during the first few days. Counter openings may be needed if one is not sure of the aseptic condition of the wound. They do no harm and may prove safety valves against latent infection."

Stimson in his 1917 edition of "Fractures and Dislocations" states that in those fractures due to direct violence "an uncomplicated healing cannot be expected," while those due to indirect violence in which the wound is made from within outward, one may expect healing within a few days. This difference in course of the two types of wounds he thinks "may be found in the lowered vitality of the bruised muscles, in the products of metabolism, or in their lowered power of resistance." In the less severe wounds he uses drains in only the exceptional case, but in the more severe type—as those resulting from direct violence, he states that "drains of rubber or gauze are to be inserted." Rose and Carless also advocate the use of drains.

The quotations from these three authorities represent in a general way the universal teachings in regard to compound fractures. As may be seen, the whole line of treatments is based upon the theory that all compound fractures are unclean and that in the majority of cases as a result of the contamination which occurred at the time of the accident, a subsequent infection will arise.

That all compound fractures are to be considered as contaminated with pathogenic bacteria will be conceded. But it is the opinion of the writer that this primary infection can be controlled and that if after a thorough cleansing of the wound, any *subsequent infection arises, it is not due to the primary contamination, but to a later one,* occasioned through drains, leaving the wound open, etc. Thus an open fracture which is to be considered infected can be so cleaned as to be considered potentially clean and be treated as a clean wound.

The character and extent of the wound of the skin will vary from a small puncture wound to a large lacerated, contused area—but the treatment will be the same. In those cases in which the external wound is occasioned by a force acting from within out, which Stimson terms an indirect force, the lesion in the skin is made by the sharp cutting edge of the bone. The wound may be small or large but with little bruising of the skin, the edges being clean cut and smooth. If the compound features are produced by a force acting from without against the bone, the so-called direct force, one will usually find the wound of the skin larger and the edges ragged and badly contused. The latter type may be more soiled than the former type and through the more extensive lacerations present a greater field for bacterial invasion than is found in the former type, yet each is to be considered as an infected wound.

In both the direct and indirect types of wounds, either with the small or with the large skin opening, one may find the same laceration of the periosteum, of the fascia and muscle and of the subcutaneous tissues, with the presence of a large infiltrating blood clot and possible injury to important nerves and blood vessels and tendons, and it is in these lacerated and bruised underlying tissues that we find the media favorable for the growth of bacteria and the production of infection.

The fracture of the bone may be transverse spiral, oblique or comminuted. In comminuted fractures the loose fragments of bone should not be removed, but should be replaced in as near their anatomical position as is possible. Even those fragments which are stripped of periosteum will take their part in the reparative process of healing just as well in compound as in simple fractures. That they will undergo necrosis and thus act as sequestra and sources of infection merely because the fracture is of the compound type, has not any logical basis for its presumption. Surely no one has ever advocated that a simple fracture, which is badly comminuted, should ever be opened and a search made for small detached fragments of bone that they might be removed.

The extent of damage to the periosteum will vary with the severity of the lesion. Its torn edges are usually ragged and stripped for some distance from the shaft of the bone. The laceration of the muscles and fascias is as a rule considerable. The extent of the bruising of the muscles should be carefully noted. No doubt a great part of this occurs as a result of the trauma incident to the handling of the limb before splinting and fixation has been made. The skin is dissected from the subcutaneous tissues to a greater extent than the size of the wound would indicate. The hemorrhage associated with any fracture is always large and not only fills the space about the line of fracture, but dissects to a considerable extent into the subcutaneous tissues and between the muscle planes. This blood clot presents a most favorable material for bacterial growth.

Important blood vessels and nerves and tendons may be cut by the sharp edges of the fragments and present most annoying problems. An extensive lesion of the larger or main arteries and nerve trunks may necessitate amputation.

The skillful treatment of compound fractures depends upon the knowledge and recognition of several important facts. First, all open fractures are to be considered as contaminated, the pathogenic bacteria having been carried into the tissues either through the direct force causing the wound, or by the protruding fragment of bone becoming soiled and carrying the organisms back into the tissues as the fracture is reduced. Secondly, a certain amount of the lacerated soft parts will either undergo necrosis or have a lowered nutrition and thus have less resistance to take care of any infection. Third, any blood clot presents the most favorable media for bacterial growth. Fourth, if the wound has been thoroughly cleaned, all devitilized tissues and blood clot removed, the wound may then be considered as potentially clean and *can be closed without drains.*

The treatment of a compound fracture, due either to a direct or indirect force or associated with a large laceration of the skin, or a small clean cut puncture wound, may be outlined as follows:

Careful examination of the vascular, motor and sensory functions, distal to the wound should be made before the anaesthetic is given. If there is evidence of severance of the large nerve or artery trunks, the patient should be advised that amputation may be necessary. If tendons have been cut the ends may have retracted along their sheaths and thus this feature be easily overlooked during the operation.

After the patient is anaesthetized the operative field is shaved without soap or water and the skin covered with fifty percent of tincture of iodine. The edge of the skin about the wound is excised so as to present a fresh, well nourished border. As a rule one-fourth inch will suffice. The wound is enlarged, if necessary, in order to give a clear exposure of the underlying structures. A large wound will heal as well as a small one and is only contraindicated where the scar may be a factor in producing a disability. Debridement or excision of all contused or devitilized tissue should then be most carefully done. This is a very important step and where important structures are not involved it is better to remove too much than too little tissue. The blood clot is removed by swabs of dry gauze and the wound filled with ether. This will cause any loose tags or shreds of fascia or muscle or periosteum to float and thus be more readily seen and removed. Any bleeding points should be sutured and a careful search be made for injury to nerve trunks or tendons. It will be well to remember that large vessels may be severed and the hemorrhage controlled by blood clots which after six or seven days interval may undergo lysis and lead to severe bleeding. I have seen several instances in which this occurred in the femoral artery and in the posterior tibial artery.

The reduction of the fracture is now done. If it is necessary Kangaro tendon sutures or the Parham bands may be used to maintain reduction and will in no way complicate the healing of the fracture. Care should be used to obtain as perfect anatomical reduction as possible and all loose fragments should be utilized. If the periosteum is not too badly lacerated one may attempt to suture it. However this cannot be done except in a few cases.

The repair of any tendons should be done with silk sutures and an attempt to suture the tendon sheath with No. "00" plain cat gut should be made. The muscles and fascias are brought together with some absorbable suture material, as plain or chromic cat gut. The skin is then closed tight with interrupted silk worm sutures and an alcohol dressing applied. Drains, either to the bone or the subcutaneous tissues, *are not to be used.*

The fracture is now to be treated as a simple fracture. Some form of splint which will maintain the reduced position of the fragment is to be used, but which will also allow of inspection of the wound and the use of moist dressings should it become infected. The writer uses almost exclusively the Thomas Splint as subsequent dressings may be made without moving the fragments or changing any extension that is being used. If plaster of Paris is to be used the operation should be done on a Hawley fracture table, which will admit of the application of the cast without changing the position of the limbs after operation. One should also reinforce the cast so that a window may be cut to allow inspection of the wound and any necessary dressing. The plaster of Paris cast will be rather difficult to use should the wound become infected and wet dressing be necessary.

The patient should be watched very carefully for the next few days. The temperature should be taken every three hours and notes made as to any local signs of inflammation. Throbbing and ache at the site of the wound, associated or not with a rise of temperature, demands immediate inspection of the wound. A rise of temperature alone may be due to absorption of blood or to the so-called "post operative" elevation. If signs of infection are present one or two of the sutures should be removed and a small probe inserted to determine whether pus has formed in the deeper structures. If pus is found then the wound should be considered as infected, all sutures removed, the wound opened

wide down to the bone and the treatment directed to control the infection. This phase of the treatment will vary with the operator. The writer has used the Carol-Dakin technique with gratifying results. The merits of other methods will not be discussed in this paper.

Compound fractures produced by bullets should be considered as clean wounds and operation is contra-indicated, unless the removal of the bullet is deemed advisable.

The differences in the treatment as outlined above and that of the orthodox teachings are: (1) The cleansing of the wound depends upon a careful and complete debridement rather upon the irrigation and swabbing with antiseptic solutions; (2) the layers of soft tissue structures are carefully sutured, and (3) the skin wound is closed without the use of drains.

It is my opinion that it is impossible to so cleanse the wound of a compound fracture that all bacteria are removed. If any devitilized tissues or blood clots are left in the contaminated field the bacteria are furnished with the most favorable media for their growth. On the other hand, if the surface of the wound consists of normal, healthy tissue the resistance to any bacterial invasion is much greater and bacterial growth is retarded. The return to normal conditions in the tissues is also hastened through correct anatomical replacement of the different layers. This careful suturing of the structures may also limit and localize any infection which may arise and thus prevent an osteomyelitis.

Infections in open fractures have resulted more frequently from contamination of the wound through the use of drains than from the primary wound itself. The skin is never clean and always presents a source of possible infection which may be carried in along the drain. If the wound is closed tight this factor in infection is eliminated. Under careful watching if any infection does arise with the wound closed, the stitches may be removed and the infection will not be any more extensive than had the wound been left open with drains and counter-drains.

Some surgeons have advocated the use of drains to take care of the hemorrhage, but there is not any justification for presuming that hemorrhage in a compound fracture is in itself any more a source of infection than in a simple fracture.

Through and through drains before infection is manifested, can only be condemned.

If the compound fracture involves a joint structure the treatment is the same. However in this type care should be used to wash out thoroughly from the joint any blood and to close the joint capsule as completely as possible.

Should the wound not become infected the after treatment is the same as for a simple or closed fracture. Active mobilization should be begun as soon as possible, in order to preserve the joint function and also to prevent any involvement of tendons or muscles in the scar tissue which is incident to the fracture. If the skin has been severely contused, daily observation should be made for gangrene or eschars which will come often at the end of several days. These may prove to be a source of infection into the deeper structures. This is especially likely to occur about the knee joint where the bursal sacs are close to the skin.

Twenty-eight cases of compound fractures have been treated by the method outlined above and all with one exception have been converted into simple fractures without infection. In this one case there was a very extensive laceration of the skin and soft parts, with a considerable disturbance in the circulation. At the end of nine days the wounds broke down and a culture of the colon and catarrhalis bacilli found, so it seems to be reasonable to say that this was gangrene rather than a case of infection in the true sense of the word. The other cases were of the tibia, fibula, femur, radius and ulna, and of the humerus. Two compound fractures of the patella were comminuted and there was a severe laceration of the capsule of the knee joint. Each of these cases were complicated by a simple fracture of the femur on the same side and one of them had also a dislocation of the hip on the same side. Two cases of compound Potts fracture occurred.

The conclusion that has been drawn from this series of cases is that compound fractures, when seen early and are carefully cleaned by debridement or excision of all devitilized tissues can be safely considered as clean wound and thus closed without drains.

DISCUSSION

DR. H. O. BRUGGEMAN (Fort Wayne): I am in complete accord with the basic idea of Dr. Mumford's paper—compound fracture wounds, when properly debrided, can be closed without drainage. I am also certain that a great many lives and limbs will be sacrificed if the average practitioner attempts to treat these wounds as Dr. Mumford treats them. Debridement, or rather epulchage, is a delicate, painstaking operation requiring much skill and practice—it is not the rough-hewn excision of a wound which can be carried out with a contempt for anatomy and a disregard for the future function of the limb. The war taught us that when a debridement is performed the wound should be left widely open, with the idea of a secondary closure, or it should be closed tightly without drainage. Fortunately the vast majority of compound fractures which are seen in civil life require no treatment other than the application of a sterile gauze dressing and immobilization in a proper position. When, however, a compound fracture has been handled outside the hospital,

or when it is grossly contaminated, or when there is much injury to the soft parts a debridement is imperative. If a debridement is necessary then detached fragments of bone should be removed. When speaking of war wounds a distinguished Canadian has said, "Among foreign bodies the most sinister are fragments of fractured bone." Dr. Mumford says that it is impossible to so cleanse the wound of a compound fracture that all bacteria are removed. It is therefore wrong for him to introduce a foreign body, in the shape of a Parham band, into such a wound. There is one vitally important factor in the treatment of compound fractures which was not mentioned and that is the administration of a prophylactic dose of tetanus anti-toxin.

DR. H. R. ALLEN (Indianapolis): Some years ago I devised a system of putting transfixation pins through the skin, muscles and bones. Each pin has a flat drill point on one end and a soluble metal head or gimlet handle on the other end. When you push it through the skin and other soft tissues you drill through the bones and then push it through the soft tissues on the other side. In treating a fracture of both bones in the forearm you take first one bone and then the other and that gives you fixation for each of the bones: then solder a piece of low-melting alloy between the drill handles and separatus and that gives you normal separation between the shafts of the bones. Whether these fractures are originally compound or simple they may be compounded in order to see that perfect aposition exists between the fractured ends. Do not put pins through the fracture zone but go back an inch or so and then put the retention drills through normal, healthy tissues. The pins used are steel, silver-plated. If there is any drainage material that is tolerated by the human body it is silver, and if there is any system of drainage that is thorough, it is through-and-through drainage. If you use a through-and-through silver drain you have almost answered the question of good drainage. For a number of years I have been using this method in appropriate cases and have never had a patient develop a whole degree of temperature. When it comes to leaving metallic foreign bodies permanently in arms or legs you all know there may be serious trouble, especially if you put them in the zone of the fracture, so why not put them back a little from the zone of fracture? These pins give you outside control over inside control. When you are through you can, with warm water, melt the soluble alloy stabilizers and separators and pull the pins out. Then your patient is not permanently half hardware and half human. He is all human.

DR. E. B. MUMFORD (closing): The object of my paper was to get away from the idea of drains in compound fractures. No matter what you do, you should not put in a drain to take care of some infection that may come later on.

Doctor Bruggeman spoke of treating the fractures of the simpler form by putting in a piece of gauze and letting them go. That is all right, and you can get away with it in some cases; but my plan is to get away from the drain first, and second, to use more thorough cleansing methods than swabs and antiseptics.

In regard to the use of metal bands, I do not see any reason why, if you have a compound fracture which does not become infected later on, the putting in of a band should produce any more infection than if you did not use it. My whole plea is to do away with the drain in compound fracture to take care of an infection which does not exist.

LOCAL ANESTHESIA AS A SUPPLEMENT TO GENERAL NARCOSIS*

M. N. HADLEY, M.D.
INDIANAPOLIS

While the attempt to alleviate pain by the use of local anesthetic agents is as old as the history of the race, no real success was attained until the discovery of cocain.

The history of local anesthesia really begins with the discovery of cocain. This alkaloid, which is derived from the cocoa plant, is indigenous to Peru and Bolivia and has been cultivated since prehistoric times and has been prominent in the religious and political life of the people of South America. "This plant was regarded as a gift of God, which satiated the hungry, gave renewed energy to the tired and weary and caused the unfortunate to forget sorrows." The chewing of the dried leaves became a racial peril and its cultivation was, for a time, forbidden. Observations were made from time to time by travelers in South America of the curious physiological effects of this plant upon the natives. Some of the leaves were taken to Europe and from them Nieman and Lossen of Gottingen first extracted cocain.

For twenty years following, German investigators were extremely active in accumulating clinical and experimental data on the use of cocain as an anesthetic agent in the performance of major and minor surgery. Great enthusiasm was aroused and it was confidently expected by many that local anesthesia would supplant general narcosis in the performance of all surgical operations.

In spite of the fact that warnings had been given of the dangerous toxic qualities of the drug, it began to be widely used, with the inevitable result that fatal poisoning, following

(*) Presented before the Section on Surgery, Indiana State Medical Association, Indianapolis session, September, 1921.

its use for anesthetic purposes, became all too frequent.

Unquestionably a great many deaths have been caused in this manner in comparatively recent years which should have been avoided and indeed would have been avoided had the profession been thoroughly informed of the experience of German surgeons in the early years following the discovery of cocain. Never will I forget my own experience, when, as an interne at the City Hospital on a dull afternoon with no one in the dressing room of Ward 4 but myself, I attempted to excise a perfectly inoffensive bit of scar tissue, following a circumcision. which for cosmetic reasons the patient wished removed. Not over one-half dozen m. of a 2% solution were used to infiltrate the area and yet within five minutes after beginning the infiltration, the man was unconscious and narrowly escaped death.

I later found that this experience was in no sense unique, and that within the comparatively narrow circle of one's own acquaintances, similar experiences were related. It is unnecessary to remark that since this time my interest in cocain as a local anesthetic in general surgery has been purely academic. My education, as far as its practical use is concerned, was long ago completed.

It should be mentioned, however, in passing, that during the developmental period of local anesthesia, cocain contributed a great deal to the advancement of the specialties, notably ophthalmology, rhinology and laryngology. As a result of its anesthetizing properties, when applied to the surface of serous and mucous membranes, it can be used with comparative safety.

As a result of the interest in local anesthesia aroused by the discovery of cocain and the accumulated knowledge of its dangerous toxicity, a large number of other agents were soon made. The discovery of cocain and its later preparation synthetically gave the key to the chemists for the discovery of these agents: tropacocain, eucain, holocain, stovain, alypin and novocain are the best known. All can be dismissed from the discussion except novocain.

Novocain meets all the indications of an ideal local anesthetic agent. It is nontoxic in doses sufficiently large to leave a safe margin when used even in large quantities. It is non-irritating to the tissues and wound healing is not delayed nor altered in any manner. It can be sterilized by boiling without altering its physiologic properties. It combines with adrenalin, which greatly enhances its anesthetizing properties.

The question of toxicity is of the very greatest importance. It is for this reason alone that cocain has become obsolete. It must not be forgotten, however, that novocain is a drug that has, when used in concentrated solution and large dosage, dangerously toxic properties. The secret of its safe usage lies in the use of weak solutions when in combination with adrenalin. When so combined, .05 to 1 percent solution will give perfect anesthesia maintained for one to two hours. When used in such strength, Braun has repeatedly used 250 c.c. or 1.25 gram of novocain, 18 gm. without untoward effects.

The use of suprarenin or adrenalin with novocain is absolutely essential to proper anesthesia when weak solutions are used. The use of adrenalin does not make the novocain less toxic, but it does greatly enhance its anesthetizing properties, thereby permitting complete anesthesia with small dosage.

When one comes to consider the practical use of local anesthesia, there are a number of factors which arise for consideration other than the rather narrow one of anesthesia. The safety of the procedure is admitted by all, and from my own experience, patients so operated have been universally satisfied with this type of anesthesia, which I believe is strong testimony that they suffered but little discomfort. There are, however, certain real obstacles which I wish briefly to discuss.

It is unquestionably true that there exists in the minds of a considerable number of people a prejudice against the use of a local anesthetic. This will usually be found to have resulted from a previous unpleasant experience during some minor operative procedure. They have been the victims of an alleged local anesthetic, such as carbolic acid, freezing with ethyl chloride, local application of cocain and possibly placeboes for the incision of localized abscess, such as boils or paronychias and the repair of small lacerated or incised wounds. This is purely a matter of faulty technique, as adequate local anesthesia cannot be obtained by any of these methods and it results in an unhappy memory which remains to confound the surgeon who proposes to use such a method again. Such an experience is not infrequently the beginning of noxious psychological factors which must be eliminated or controlled before local anesthesia can be successfully used.

There are also a considerable number of individuals who prefer, or at least think they prefer, to be unconscious during a surgical procedure of any magnitude performed on their own body and therefore desire some form of general narcosis. This reluctance to consciously face the ordeal of an operation, even though it be painless, throws an illuminating light on the psychology of the operative patient. It shows most conclusively to the surgeon that the task of rendering anesthetic the tissues in the field of operation is only a small part of what is necessary for the comfort of the patient and the success of the method. Indeed, I think it can be safely said that it is much easier to do

a painless operation under local anesthesia than it is to control the psychic reactions. In my experience, the real objection to local anesthesia in selected cases is not the difficulty of adequate anesthesia but of controlling the purely mental reactions of the patient. Novocain in combination with suprarenin is an ideal local anesthetic and it can be safely depended upon, when used with proper technique, to make possible many major surgical procedures without pain. It should be, and I think is, almost universally used and has become standard. But no method of controlling the purely psychic reactions of the patient has been satisfactorily developed and until this can be done, I predict local anesthesia will never develop the popularity either with the profession or the public to which its merits entitle it.

Granting, therefore, that the elimination of physical pain can be successfully accomplished by the use of novocain and suprarenin in combination, let us turn our attention to a classification and discussion of the various methods proposed and used for the control of the patient's mental reactions. These can be classified under three heads:

(1) Suggestive Therapeutics.

(2) Pre-anesthetic administration of drugs such as morphine, scopolamin and mag. sulphate, the latter used synergistically with morphine.

(3) Light inhalation gas-oxygen anesthesia.

By proper and skilful use of suggestive therapeutics, there lies a vast field of usefulness for the surgeon. Indeed, all successful surgeons are adept psychologists. Our medical friends are repeatedly and I believe rightly calling attention to the psychic damage suffered by patients especially of neurasthenic tendencies as a result of operative procedures. This damage, I believe occurs almost entirely previous to the actual operation. The ordinary operation, followed by a smooth convalescence, does not, as a rule, unfavorably affect the patient's psychic reactions but the acute emotional reactions initiated the moment the question of surgery is broached, which continues all too often to the very moment of anesthetic unconsciousness, plays havoc with his psychic centers. The basic cause of this pre-operative psychic disturbance is fear, a very elemental but profoundly important human emotion. Its manifestations are often masked and show themselves in aberrant mental reactions. If the surgeon can, by the influence of his own personality, banish fear from the consciousness of his patient, he has accomplished successfully the first stage of not only local anesthesia but general narcosis.

I very well remember the remark of a man made some six months following a simple hernia operation. After all arrangements had been made, room engaged, business affairs adjusted for a month's absence—in fact, very systematic and completed plans for an elective operation, he entered the hospital and registered and while going up on the elevator to his room, he told me he was seized with a panic of fear which shattered his nerves and required the exercise of all the will power at his command to prevent him bolting and running at the first opportunity. This patient, it is unnecessary to remark, did not have a successful first stage anesthesia. Unfortunately, the surgeon does not control all of the avenues to the patient's consciousness. His friends and relatives have access to it and are quite as apt to augment as to alleviate his fears.

But the most pernicious factor in the production of noxious psychic disturbances in the local anesthetic patient is the average modern hospital. He no sooner enters the door than his consciousness is assailed by unpleasant odors, disquieting noises and, as a rule, not a single beautiful thing meets his gaze. At a time when his intellectual sensorium is extremely sensitive, he is flooded with painful stimuli which disorganizes his courage and weakens his stamina. Add to this the sights, sounds and odors of six or eight operating rooms on the morning of the operation, and you can get some conception of the impossibility of the average hospital for successful local anesthesia. Suggestive therapeutics is very difficult to accomplish in such an environment. Recently, while doing a double herniotomy under local anesthesia, the patient was greeted by the frightened screams of a child being etherized preparatory to a tonsil operation, and a little later he was an unwilling spectator of this somewhat sanguineous procedure through the open door. It required an extra cigarette before he entirely recovered his mental equipoise.

The routine observed in the operating rooms of the average modern hospital would have to be greatly altered to meet the requirements of successful local anesthesia. All noxious sights, sounds and odors eliminated and a real effort made to soothe rather than irritate the patient's sensibilities.

(2) Pre-operative administration of drugs.

I have purposely classified the use of drugs such as morphine and scopolamine in local anesthesia as one of the methods of controlling the patient's psychic reactions. This I believe to be their principal function. Their use does not permit of any less quantity of novocain nor less infiltration of the operative field. But the morphinized patient is drowsy and remarks that he wants to take a nap. In this condition, he is much less susceptible to all kinds of conscious stimuli and to that extent will his intellectual sensorium receive less insult. The threshold of psychic impressions will be raised so that he misses a considerable number that might be disturbing in character.

Gwathmey has recently advocated the use of magnesium sulphate solutions to be used in conjunction with morphine. He gives 5 c.c. of 25 percent solution diluted to 200 c.c. and given intravenously. His clinical experience would seem to indicate that when thus used the effects obtained from morphine even in small dosage are greatly enhanced. This, he states, is the ideal pre-anesthetic medication for gas-oxygen anesthesia. If this should prove to be true, it would be equally valuable in local anesthesia.

(3) Light inhalation anesthesia as a method to control the patient's psychic reactions.

Crile has quite recently been operating in a certain group of cases under a form of anesthesia which he designates as analgesia. In addition to completely blocking the sensory paths in the field of operation by novocain, he administers a very small amount of gas—oxygen. The patient is entirely conscious and knows everything that is going on. His mental state is one of exhilaration.

It seems to me that the part played by this gas-oxygen in the so-called analgesic anesthesia, as used by Crile and others, is largely a psychic one. Just as the novocain produces a sensory block, so does the light gas-oxygen produce a psychic block and renders the patient immune to the noxious stimuli of his immediate environment. The real anesthesia is produced by the novocain while the patient's mental reactions are controlled by light gas-oxygen.

A very interesting phenomenon in the use of local anesthesia in the performance of major surgery is the very profound effect upon the psychology of the surgeon. The mental reactions of the local anesthetic patient have been discussed at some length. Of no less significance is the striking change in the mental process of the surgeon, when in the one instance he is operating on an unconscious patient and the other a fully conscious and intellectually alert individual. He immediately becomes aware that he is operating on a living, conscious, human being whose physiological processes are intact and the tissues of whose body react in direct ratio to the injury done them. Blood vessels, nerves, fasciæ and muscles all have a new significance.

When we stop to reflect on the early training of surgeons, it is not difficult to understand how we may develop with an improper attitude toward living tissue.

The student's first introduction to the manual exploration of human tissue is in the dissecting room. It is unnecessary to remark that here delicacy of touch is not regarded as an essential quality of good technique. The next step in his training is a course in operative technique on the cadaver and later a course in dog surgery. By the time these courses have been completed, whatever instinctive reverence the student may have possessed for living, human cells has disappeared. He begins operating as an assistant on unconscious patients whose tissues become the recipient of the same kind of manipulation as used in the dissecting room or dog surgery.

I have repeatedly observed internes, while assisting them in hernia and other operative procedures, show a disregard for the rules of gentle manipulation that I feel sure was an acquired and not a natural trait. With an alert human being under the knife, the tissues involved take on something of the significance of conscious existence and it would, in my judgment, add greatly to the value of surgical training if the student did his first operative work under local anesthesia.

TECHNIQUE.—The technique of local anesthesia, while not difficult, requires close attention to detail. Novocain, for reasons already given, is the drug to be used. When a considerable field is to be infiltrated .05 percent solution is the proper strength. As much as 250 c.c. or 300 c.c. of such a solution can be used without danger. In minor operations, such as amputation of fingers and toes, 1 percent solution is advisable. It should be made with physiological salt solution and boiled. Two to three minims of 1-1000 adrenalin solution should be added to each ounce of novocain solution after it has cooled. If the adrenalin be a synthetic preparation, it can be boiled with novocain. A fresh solution should be made for each operation and for this reason tablets containing novocain and synthetic adrenalin are the most convenient for daily use. A syringe holding 5 or 10 c.c. with a locking device to prevent the needle from slipping is necessary for smooth injection. Due to the increasing use of local anesthesia, a good many devices for expediting the injections are appearing on the market. It remains to be seen how practical they will prove in practical use.

The local anesthetist should familiarize himself with sensory nerve distribution. His entire attention at this stage of the operation should be focused on injecting the novocain into those tissues which carry the sensory nerves supplying the field of operation. The skin and fascia are the planes that contain most of the sensory nerves. Fat and muscle are relatively insensitive.

The solution can be injected directly into the tissues to be operated upon, the so-called infiltration anesthesia, or the line of incision circumscribed, thereby blocking all sensory nerves entering the field of operation—the so-called circumduction or conduction anesthesia. Both have their distinct indications. I prefer infiltration anesthesia in all abdominal work and non-inflammatory superficial tumors, while conduction anesthesia is essential in dealing with inflammatory skin lesions and the amputation of toes and fingers.

If one uses the method of infiltration, the operation may proceed immediately following the injection, while if the conductive method be employed, a certain length of time must be granted for complete anesthesia.

There is a marked alteration in the appearance of the tissues following the injection of larger quantities of the solution. They appear edematous or watery and usually bloodless as a result of the adrenalin. It requires some experience to recognize tissues readily in a field so altered.

An ample margin beyond the immediate limits of the operative field should be anesthetized, as it is very disconcerting to the patient to have a snip of the scissors or artery clamp catch a sensitive nerve. A misstep of this kind on the part of an operator will very quickly demoralize the courage of a patient. One can usually sense the nervous reactions of his patients and, as a rule, they are at light trigger tension.

It seems to me that there is an excellent field for the general anesthetist to develop in mastering the technique of local anesthesia. There is every reason why this should be done by a trained expert. Its technical possibilities are susceptible of quite as much development as are those of general narcosis, indeed, I think more so. If an expert were available, I feel sure it would greatly increase the use of local anesthesia.

In conclusion, local anesthesia should not be regarded as a rival of general anesthesia, but as a supplement to it. Some form of general narcosis remains the anesthetic of choice in the great majority of major surgical procedures. For myself, I now regard novocain the anesthetic of choice in all uncomplicated hernia, including umbilical, ventral, inguinal and femoral; all minor operations on the extremities, such as amputation of fingers and toes; excisions of all superficial growths involving skin and subcutaneous tissues and resection of ribs for empyema.

The benefits to be derived by the patient from local anesthesia are not confined to saving him from the ill effects of general narcosis. They arise quite as much from a better appreciation on the part of the surgeon of the psychcological factors involved in an operation both in relation to himself and the patient.

DISCUSSION

DR. A. C. ARNETT (Lafayette): We have, as Dr. Hadley mentioned, three methods of anesthesia—general, local and a combination of the two, all of which have their various adherents—some of them almost fanatical. General narcosis has been, is now and will continue to be the method most used in general surgery.

Local anesthesia, which Dr. Hadley discussed rather in detail, has its positive indications. There are certain types of cases in which, to my mind, it is very positively indicated, such as the resection of the ribs in empyema, because we do not think these cases should have a general narcosis by the inhalant method in any form.

I would like to emphasize what Dr. Hadley said regarding local anesthesia—that it gives a surgeon a training to operate under local anesthesia alone that he cannot get in any other way. It gives him a respect for tissues and many lessons are impressed upon him that he does not forget. I think every surgeon should be able to do any operation in his repertoire under local anesthesia, because it can be done successfully.

Dr. Hadley mentions the difficulty of mental preparation with a very light gas-oxygen anal- In certain cases where local anesthesia is positively indicated you can produce your mental preparation with a very light gas-oxygen analgesia and proceed with the administration of your local anesthetic, which is nothing more nor less than the method of Crile. I cannot conceive of a nephritic or cardiac condition that a little gas-oxygen would harm. The anesthetic should be preceded by the administration of some indicated narcotic, except in a very few instances.

Coming to the combination, I think the ideal agent for general narcosis is gas-oxygen, if you use a local anesthetic in connection with it, for the reason that gas-oxygen is flexible, it is quick, it is not unpleasant, and you can produce almost any degree of narcosis you wish. In adding it to your local anesthetic you can produce absolute relaxation of the belly muscles in abdominal cases. One of the drawbacks of the combination of local and general anesthesia that more or less frequently is encountered is that sometimes we are not able to work with our regular anesthetist, and to get the best results for this method you must have absolute cooperation between the surgeon and anesthetist, which means more than mere cooperation, as the anesthetist must know what the surgeon is trying to do and instinctively cooperate with him.

Dr. Hadley mentions another thing that I do not quite comprehend. That is the training of specialists in anesthesia and the administration of local anesthetics. It seems to me that the surgeon who is capable of doing an operation under local anesthesia should be capable of producing that anesthesia and should be the one to do it. I admit that if he operates case after case it might take too long, but his assistant, who is his right hand, should precede him and anesthetize the patient if he uses a local anesthetic pure and simple.

DR. FRANK H. JETT (Terre Haute): The doctor spoke about adrenalin as a local anesthetic. I used fifteen minims of adrenalin to the ounce at first, but I found I was getting

a toxic effect from the adrenalin. Now I do not use more than five minims to an ounce of solution and do not like my patient to get more than fifteen minims in an operation. To use 250 c.c. as he mentions, would be to give two drams of adrenalin solution. This is quite a large dose of adrenalin.

Another thing, I do not think you learn to use a local anesthetic as quickly as a general narcosis. It is not so simple as "to take a small needle and get a start and take a long needle and go deeper". You are expecting that patient to stay under for an hour, and if you expect that you must give an intradermal injection first; then infiltration; then you can use your deep block of the nerve. I think the nerve block in a hernia operation is very important. One drop of solution in that nerve is worth an ounce of solution scattered around in that neighborhood. It is not necessary to use a large amount, except in the hands of the beginner until he learns where to put it; but it is necessary to put it in the right place.

Older people need local anesthesia; they do not stand a general anesthetic well. There is no better indication for local anesthesia than strangulated hernia, and this should never be operated under general narcosis. Gastrojejunostomy can be done under local anesthesia. But local anesthesia cannot be used as a pick-up. Knowing your nerve supply, sharp dissection, handling tissue tenderly, never being rough or being in a hurry, and knowing what you cannot do, will make local sometimes life saving. Local anesthesia will be used more and more; there is no doubt in my mind about that.

DR. GEORGE R. DANIELS (Marion): There are two or three little things about the local anesthesia that I want to speak about and that I think important. I think it will do away with general anesthesia. In the first place, as the doctor emphasizes, you must have the confidence of your patient. You will notice a good local man is a good conversationalist. He gets the attention of the patient and keeps up a rapid fire of talk, and many times he has finished before the patient realizes he has had anything done. A small hypodermic needle is necessary, a very small one. You can puncture the skin more readily with a small needle than with a large one, and do it quicker. Then have a long needle, a good steel needle fully 2½ inches long You get through a lot of tissue, and you can direct it; it will not break, it will bend. Do not have a 5 c.c. syringe, have a 30 c.c. syringe, and have three or four of them lying around.

I am not at variance with the doctor in any way, but these are little minor details that are important in local anesthesia, and they are the very things we may overlook. The chief thing is the quick thrust of the first needle. Then you can take a long needle and go in better.

I do not know if apothesine is the same as novocain. However, you can use all the apothesine you wish, or you can use a large amount of a one-half percent solution of novocain. I would say to have at least two of these ounce syringes ready.

DR. MURRAY A. HADLEY (closing): All I wish to say is this: It is apparent that local anesthesia is not a very popular type of anesthesia, and the reason I think is to be found in the fact that our hospitals and our training, everything connected with operative procedure, has been built around a different idea. Until there is a change in that direction no one will have a great amount of pleasure operating under local anesthesia. Unquestionably the burden is transferred from the patient to the surgeon in local anesthesia, because it is harder to operate. I hope as a result of this discussion to in some ways popularize the method. I am not an extremist in this method of operating. But you can operate painlessly in a great many major operations under local anesthesia. In a certain group of cases local anesthesia is required. Another group does not require it, but you get along better with local anesthesia than with general narcosis. There are many people traveling around with hernias that should be operated, and they will be operated more quickly if they find it can be done under a local anesthetic instead of a general narcosis.

CONCUSSION OF THE BRAIN AND FRACTURE OF THE SKULL*

R. E. WHITEHEAD, M.D.
CITY HOSPITAL, INDIANAPOLIS

CONCUSSION

A. DEFINITION.

Concussion of the brain or stunning is a clinical condition characterized by more or less disturbance or complete suspension of the functions of the brain as a result of force applied to the head, which leads to some commotion of the cerebral substance, and may or may not be associated with hemorrhage within the cranial cavity.

B. SYMPTOMS AND SIGNS.

(a) Headache.

Headache is the chief symptom of concussion of the brain. It is present sooner or later in almost every case. It may vary in character from a sharp, acute, throbbing, beating pain to a dull ache or heavy feeling about the head.

Associated with this symptom is restlessness and nervousness.

(b) Nausea.

Nausea is the next symptom of importance.

Associated with this is vomiting, which is

(*) Thesis for cum laude degree, Indiana University School of Medicine.

usually present from one to three hours after eating.

(c) Unconsciousness is a condition frequently found in profound concussion.

Associated with this is delirium.

(d) Other subsequent and frequent clinical findings are elevation or lowering of temperature, increase or decrease in pulse rate and blood pressure, choked disc, pupillary changes, temporary paralysis, death.

C.

In a series of nineteen cases of concussion admitted to the City Hospital of Indianapolis during the year 1920, the following symptoms and signs were present:

(a) Headache of some character in every case—100 percent.

(b) Restlessness and nervousness in 21 percent.

(c) Nausea present in 25 percent.

(d) Unconsciousness more or less complete in 21 percent.

(e) Delirium in 5 percent.

(f) Elevated temperature, 25 percent.
Lowering of temperature, 5 percent.
Increased pulse rate, 21 percent.
Lowering of pulse rate, 10 percent.
Involuntary micturation, 5 percent.
Death, 5 percent.

Morbidity. Questionnaires and examinations of eleven of the nineteen cases of concussion, taken six months to one and one-half years after the accident, show the following:

1. No development of new cranial nerve changes in addition to those found present a few hours after the accident.

2. All but three of the patients complain of frequent headaches, which were not present before the accident. Associated with this symptom is nervousness, present in six cases.

3. One patient does not remember very well since the accident. He feels as if he might fall after stooping. He has a quick temper, and is very impatient since the accident. He wants to stay at home and sleep. Formerly he was always out.

4. Another patient admires women now, and wants to be in their society constantly, a thing which developed since the accident.

5. Still another finds his legs very weak, and cannot use them long at a time. He is also more drowsy than before.

6. A boy, age 15, likes to go to school now. He never did before the accident. He craves oranges. His knees and ankles hurt at times. He feels as if he could not stand upon them. Although he cannot remember as well since the accident, his present school record is much better.

7. After lying down, one patient feels very dizzy when getting up.

8. A boy, age 10, is more like a child, according to his mother. He does not learn as well in school and suffers from terrible headaches.

Six of the eleven cases heard from are unimpaired in ability to work. The seventh is unable to work. The eighth is a teamster, and must keep someone with him all of the time. Since the accident, he has fallen from the wagon upon the back of one of his horses. The tenth is unable to do any kind of work. The eleventh cannot work as he used to. He is laid off from time to time and is not strong.

Much of the late evidence goes to show that some of these cases which were diagnosed as concussion may have had associated with the injury fracture of the skull.

Discussion of Morbidity. Thus we see that although the mortality is low, the morbidity is very high. Recovery from concussion may be complete and permanent, but on the contrary, the entire nature may undergo a change. Such a change, which may not be evident for weeks or months, is apt to be manifested by egotism, selfishness, censoriousness, mendacity, great irritability, outbreaks of violent rage about trivial things and forgetfulness. The forgetfulness is particularly as to recent events. There are headaches, insomnia, attacks of depression, lassitude and vertigo. Such a patient may be susceptible to alcohol, the heat of the sun, and physical or mental strain. He can do nothing requiring mental effort.

After concussion, a patient may develop hysteria, epilepsy, amnesia or actual insanity. A condition resembling Korsakow's psychosis may develop. (Confusion with gaps in memory which are filled up spontaneously by fabrications, the patient also having multiple neuritis.)

Confusional insanity or mania may arise, or a condition like hallucinatory paranoria or mental weakness which may resemble paresis.

Concussion may pervert or wipe out all memory of the causative accident, and also, strange to say, of a varying period preceding the accident. The loss of memory may be permanent, or may only be temporary. Statements made regarding an accident by one who has had concussion must be received with many grains of salt. Victims of arteriosclerosis are particularly apt to develop mental trouble or neurasthenia. Rege insists upon this.

The actual damage of concussion can be measured only by the physical and mental disturbances which follow—either immediately, with partial or complete loss of consciousness or delayed psychomotor symptoms, which may not develop for from twelve to forty-eight hours.

History of Concussion. The early thought in regard to concussion was that it was a condition produced by molecular vibrations in the nervous substance of the brain, unattended by any demonstrable injury.

Duret's observation profoundly modified surgical thought, and led to the opinion that in concussion of the brain, there is an injury to the brain itself; a rupture of cerebral vessels brought about by the advance and recession of waves of cerebral fluid. The waves flow in the direction of the force.

Keen says that there may be slight brain injuries, which can properly be called "concussion", but it is better to consider concussion as identical with laceration of the brain.

Kocher considered concussion as identical with contusion of the brain.

Von Bergman claims that there is such a condition as concussion, which may be pure concussion, or may be associated with organic damage, and even if a man dies, and is found to have an organic injury, the concussion may have caused, or at least have hastened, the fatal result.

Discussion. The word "concussion" is derived from the Latin *contuere*, meaning "to shake up". It is evident that direct force of any character applied to the head will produce a momentary displacement of the brain. Force applied to any part of the body may be transmitted to the brain and produce concussion indirectly. Therefore all brain injuries are primarily concussions.

Concussions may be simple or may be associated with many other forms of injury, *e. g.*:

(a) Scattered areas of contusion.

(b) Lacerations.

(c) Local or widespread punctate lesions of the blood vessels producing hemorrhage of the pia-arachnoid, and even of the cortex as well.

(d) A break in the continuity of the bones of the skull.

(e) Laceration of the scalp.

2. The blow gives rise to a stimulation, which is followed by a relaxation or exhaustion of the nerve cells. The higher the type of tissue, the more susceptible and responsive is it to stimuli. The more responsive to stimuli, the greater the degree of exhaustion. The brain is the highest type of body tissue. Mild exhaustion produces a desire for sleep; more severe exhaustion, headaches of varied character, while extreme exhaustion is manifested by a reversible process of unconsciousness.

The more intense the exhaustion, the deeper the unconsciousness. This condition is closely allied to shock, and according to Crile is but one form of shock.

3. Exhaustion and even unconsciousness may result without any gross anatomical lesions. If, however, vessels are ruptured, and tissue is deprived of oxygen, according to Cannon, the deoxygenized tissue takes up fluid and swells. The resulting edema may be localized or generalized. If the edema is extreme, and the cells die, liquefaction necrosis ensues. This is then a supplementary condition, which may be associated with concussion.

4. The presence of large ruptured vessels in the meninges, or a break in the continuity of the bones of the skull, but adds to the gravity of the injury.

FRACTURE

Fracture of Skull. A fracture of the skull is a break in the continuity of the bones which constitute that structure.

The total number admitted to the City Hospital during the year 1920 was twenty-five. The total number of deaths was fifteen, or 60 percent.

Eight of the fifteen cases (46.6 percent) resulting in death were moribund upon admission to the hospital. Four of these cases died in the admitting room a few minutes after entering. One case died in six hours; another in fourteen hours.

Two of the moribund cases were operated upon. In one case pieces of bone were removed from the compound fracture and the bone shelf elevated. This case died in five hours. The other case was operated upon six hours after entrance and decompression done, but the patient died in the surgery.

There were seven cases which were not moribund, but which died. Upon three of these, operations were performed. One case in fair condition was given an anesthetic a few hours after admission and died before the operation was started. Death was probably due to the ether, which increased the already existing exhaustion. A decompression was done upon a second immediately upon entrance, who had a compound depressed fracture of the vault. Pieces of bone were removed, and the wound closed. The patient died in twenty hours.

A third case was given an anesthetic upon admission. The wound was extended and revealed a fissure fracture through the vault. Blood was oozing through the fracture. The wound was cleaned and closed with drainage. The patient died in 46½ hours.

Of the remaining four cases, who were not moribund, upon which no operation was performed, but who died,

One lived twenty-four hours;

One lived twenty-five hours;

One lived twenty six hours;

One lived four days.

Number of decompressions done, 2.

Ten, or 40 percent, of the cases which were diagnosed as fracture of the skull lived. The x-ray disclosed fracture in six, or 60 percent. Four of these were large linear fractures through the vault.

Case No. 1. A man, aged twenty-one, had a wide linear fracture through the parietal bone, and remained in the hospital ten days.

Case No. 2. A boy, aged six, had a wide linear fracture of the vault, extending from the frontal to the occipital bone. He remained in the hospital for twelve days.

Case No. 3. A boy, aged eleven, had a wide linear fracture through the occipital bone. He remained in the hospital fourteen days.

Case No. 4. A man, aged thirty-five, had a wide linear fracture in the lower occipital bone, extending forward into the base (middle fosse) and involving the temporal bone. This patient remained in the hosiptal thirty days.

Case No. 5. A man, aged twenty-six, showed from an x-ray a punctuate fracture over the left eye, with displacement inward of a few bony fragments. An operation was performed, and the fragments removed. The patient remained in the hospital twelve days.

Case No. 6. A man, aged thirty-four, had a linear fracture extending from the frontal region two inches above the left orbit on a horizontal plane, to the left occipital region. Decompression was done. The patient remained in the hospital thirty-four days.

In the remaining cases, the x-ray showed no perceptible fracture, the diagnosis being clinical.

Case No. 7. This case was a woman; age not given. Clinical diagnosis of fracture of the base. Temperature slightly elevated for a few days. There were early signs of increased intercranial pressure. There was no definite evidence of fracture—diagnosis questionable. The patient signed her own release in ten days.

Case No. 8. A man, aged forty, was struck by a street car. On admission, he was found unconscious and vomiting. On the following day—T. 98, P. 50, R. 14. On the following two days, the patient had a slightly elevated temperature, 99 to 100. Pulse 60, then 70 Paralysis of the left arm existed, which persisted. He left the hospital in thirty-one days.

Case No. 9. A boy, aged seventeen, was in a motorcycle accident. When admitted he was unconscious. No abrasions were found about the head. The patient was bleeding from the nostrils and ears. No paralysis; pulse strong and regular. Cheyne Stokes respiration absent.

The patient gradually improved, until the eleventh day, at which time he developed a large mass over the right mastoid region. A mastoidectomy and decompression revealed practically nothing. An incision of the mass later revealed a large pocket of pus (staphylococcus), communicating with the external auditory meatus. Later pockets of pus developed in other parts of the body, but were incised. The patient improved and left the hospital in thirty-two days practically well, except for a slight mental aberration.

Case No. 10. A man, aged twenty-six—no history of the injury. The patient remained unconscious for a number of days, but no physical signs of any importance could be found The patient was nauseated and vomited. The spinal fluid on the fourth day revealed slight intracranial pressure. The eye grounds were negative.

The patient gradually regained consciousness, but remembered no accident. He remained in the hospital thirty-four days.

Morbidity of Patients Having Fracture of Skull. Questionnaires and examinations of six of the patients mentioned above as having fractures of the skull who lived show from six months to one and one-half years later the following:

1. One patient, who had a punctuate depressed puncture of the skull, has been very forgetful since the accident. Although the patient is more nervous, his working capacity is good.

2. Two patients who had large linear fractures of the vault, upon which no decompression was done, complain of headaches at times, together with dizziness and swimming in the head. These two are, however, in as good a physical and mental condition as before the accident.

3. Another has never been entirely rational. He cannot read or write. He sees large objects before his eyes, and has frequent attacks of severe headaches.

4. One patient, whenever he is under any stress, especially mental strain or suspense, becomes very nervous and has a dull aching pain in his head difficult to locate or describe. At times he is apt to go to pieces, and finds self control difficult.

Discussion. In fracture of the skull, mortality and morbidity are both high. Fractures of the base are apt to be associated with paralysis of the cranial nerves. The palsy indicates the site of fracture. In fractures of the anterior fossa, the olfactory nerve may suffer. In fractures of the middle fossa, the facial nerve most often suffers. The eighth is sometimes injured. Other nerves which may suffer alone or in combination in fracture of the base are the abducens, the motor oculi communis, the trigeminus, the pneumogastric, the optic, the spinal accessory, the hypoglossal and the gloss-pharyngeal. Optic neuritis often arises after the first week. Added to the above may be all the conditions associated with concussion.

Harte (Annals of Surgery, October, 1901) has collected forty-six positive cases of fracture of the base of the skull from records of the Pennsylvania Hospital—35.5 percent recovered.

Ranschoff collected 190 cases of fracture of the base of the skull. The mortality was 65 percent. Over one-half of the fatalities were within twelve hours. Only 15 percent died after the second day. Of 98 cases with profound coma and respiratory disturbance, 90 percent died. (Annals of Surgery, July, 1910.)

According to Hartley, in cases treated expectantly, the mortality is 90 percent; in cases treated by operation, it is less than 35 percent. (American Journal of Surgery, December, 1919.)

History shows that 2 percent of all fractures are skull fractures.

1. Simple linear fractures of the vault of the skull without symptoms of brain compression are attempts of nature to produce natural decompressions, and require no surgical intervention. If compression symptoms become present, they must be taken care of accordingly.

2. Simple depressed fractures of the skull, with or without symptoms of brain compression or irritation, should be treated by elevation.

3. Compound fractures of the skull should be treated as compound fractures of other bones.

Fractures of the Base. Fractures of the base are much more common than is commonly supposed. The x-ray will not always disclose fractures through the small bones of the base. Therefore a diagnosis of fracture here is very difficult without the presence of any localizing symptoms or signs.

Fractures of the base are more common through the middle fossa, but are frequently associated with a fracture through the anterior fossa. The fractures through the posterior fossa are almost always fatal. A severe concussion is necessary to break this bone, and besides, it lies very close to the medullary centers. Fractures through the anterior and middle fossa are prone to be compound on account of their proximity to the nose, mouth, ears and pharynx. Complications frequently follow, such as:

1. Meningitis.
2. Brain abscess.
3. Deep cellulitis and abscess of the deep facia of the neck.
4. Metastatic abscess and septicemia.

THE SIGNIFICANCE OF SYMPTOMS AND SIGNS

Signs.

The first procedure is to determine the amount of intracranial pressure. This pressure is always dangerous, but only fatal when it breaks down the vagus and vascomotor mechanisms.

The Opthalmoscope.

A moderate degree of intracranial pressure may be revealed by slight dilation of the retinal veins.

The signs of a still increasing intracranial pressure beyond a dilation of the retinal veins are:

1. An edematous blurring and obscuration of the nasal margin of the optic disc.
2. A similar haziness of the nasal half.
3. Finally a blurring of the temporal half, resulting in the total obscuration of the optic disc.

These are *early signs* of increasing intracranial pressure.

The term "receding papillitis" is applied by oculists to denote the retinal conditions associated with decreasing intracranial pressure.

Pulse.

The pulse rate following the accident is frequently over 110 until the shock gradually disappears. A pulse of below 60 is a sign of break in the mechanism of the vasomotor system, and is a *late sign* of increased intracranial pressure.

Respiration.

The respiration, like the pulse rate, may be affected by shock and exceed 30. If the intracranial pressure increases, and the number decreases to the Cheyne-Stokes type of breathing, the prognosis is very grave.

Blood Pressure.

A high blood pressure is a *very late sign* of increased intracranial pressure. Its presence signifies an attempt of the vasomotor mechanism to force blood into the intracranial chambers, and thus into the medulla by overcoming the already existing increased intracranial pressure.

Paralysis may localize the sites of fracture of the base or extradual hemorrhage.

Lumbar Puncture.

Spinal puncture or rachicentisis is dangerous in cases of shock, if large amounts of fluid are removed. A few drops is all that is necessary for diagnostic purposes. If the fluid is clear and under pressure, frequent rachicentisis of not more than 5 c.c. are safe.

Spinal punctures are good to relieve headache, especially in fracture of the base. Spinal puncture will not relieve pressure due to localized areas of edema.

THE MECHANISM OF COMPRESSION ACCORDING TO KOCHER

1. Increased intracranial pressure first expels the excess cerebro-spinal fluid, and since brain tissue is noncompressible, it then compresses the local blood vessels so that the amount of intracranial blood is slightly lessened; since the blood in the cerebral veins is under a very low pressure, less blood will flow through them, and a slight anemia is produced. If the cerebral pressure is increased, the blood in the retinal veins is held back and a venous stasis is produced, its symptoms being headache, drowsiness and possibly stupor. The pulse, respiration and blood pressure are not affected. The retinal veins are usually much dilated.

2. Kocher's Second Stage of Compression.

If the intracranial pressure still rises, it tends to approximate the pressure in the capillaries, and so a partial anemia results. If this anemia

is local, the results are impairment of function of that area. If it is present in the medulla, a slow pulse of 60 or below will be present due to stimulation of the vagus nucleus, and a slight rise in the general arterial blood pressure, due to the stimulation of the vasomotor center causing not only a constriction of the peripheral blood vessels themselves, but especially of the vessels of the splanchnic field.

The anemia then becomes more marked. Headache is more severe, associated with restlessness and even delirium—a definite cyanosis appears. These definite, though moderate, signs of high intracranial pressure form Kocher's second state of compression clinically.

An ophthalmoscopic examination reveals large dilated retinal veins, with or without edema of the discs.

This is the best time to operate in order to relieve intracranial pressure, before the signs of medullary compression have occurred.

3. Kocher's third stage of compression clinically consists of the major bulbar signs of compression. As intracranial pressure continues to rise, it produces a greater anemia of the medulla, so that the intracranial pressure at times may equal the capillary pressure of the medulla. If it were not for the regulatory mechanism of the circulation in the medulla, such an occurrence would result in the immediate and permanent cessation of cardiac and pulmonary activity, and, therefore, the death of the patient. Fortunately, however, as the anemia becomes greater, this very absence of blood so stimulates its vasomotor center that the general arterial blood pressure is raised, more blood is forced into the medulla, and in this manner the partial anemia is overcome, at least temporarily.

Clinically, the picture is most striking, as the intracranial pressure increases until it tends to prevent the normal flow of blood into the medulla; the resulting partial anemia so stimulates the vagus center that the heart rate gradually becomes lowered to 50 and below, and the pulse to a full bounding character; the respiration becomes less and less frequent until a period of apnea or non-breathing results, due to the anemia of the respiratory center of the medulla.

The patient may not breathe for forty seconds or more. During the earlier part of this period of "down wave" the blood pressure falls slightly, the patient gradually becomes more and more stuporous, the pupils slowly dilate, and the reflexes are abolished—the results of a definite anemia of the medulla. Then, as this prolongation of the medullary anemia stimulates the vasomotor center to renewed activity, the general blood pressure is gradually raised to overcome the intracranial pressure until the blood is forced into the medulla, the heart rate increases, and then the patient begins to breathe again, as a result of the respiratory center being resupplied with blood.

During this period of "up-wave", the cyanosis is extreme, the pupils contract, and the patient may groan, become restless and even conscious. The reflexes return, and the ophthalmoscopic examination reveals double papelledema or "choked discs", thus the intracranial pressure is so high that the resulting anemia produces an edema of the optic nerve discs, so that their margins and entire discs themselves are obscured, the retinal veins are dilated, and at times buried in the edematous retina. Even the other extracranial veins of the scalp and particularly of the upper eye-lids are dilated.

As the medulla becomes supplied with blood again following this period of "up-wave", the stimulation of its vasomotor center is lessened so that gradually the general arterial blood pressure diminishes until the symptoms and signs of the "down-wave" become more and more marked; then the "up-wave" begins again, as outlined above, and this periodicity of symptoms and signs depending upon the rise and fall of general blood pressure, causing the Cheyne-Stokes type of respiration (Fraube Herring waves) occurs again and again. This condition may continue for hours.

4. *Kocher's Fourth Stage of Compression.* Unless the intracranial pressure is now quickly relieved by an operation (and even with an operation the chances of recovery at this stage of compression are slight) this regulatory mechanism of the medulla will finally become fatigued so that the vasomotor stimulation will no longer be able to raise the general arterial blood pressure above the intracranial pressure, and during the "down-waves", a permanent fall of blood pressure will occur; the respiration will no longer begin again, and the heart will continue to beat irregularly and rapidly as a separate organ, until the blood pressure gradually falls to zero, so that even the heart itself will cease beating.

This stage of respiratory paralysis, associated with rapid and irregular cardiac efforts, dilated pupils, profound coma, and complete muscular relaxation, and a permanent fall of general arterial pressure, forms Kocher's fourth stage clinically of permanent anemia of the medulla—the stage of loss of compensation or the terminal stage always resulting in the death of the patient.

TREATMENT

1. Rest and elimination of all external stimuli are the first steps.

2. Elevate the head with one pillow if hemorrhage is suspected. If hemorrhage is ruled out, and the shock is the predominating feature, lower the head and elevate the feet.

3. Gastric lavage will thoroughly relieve the stomach of its contents if patient is vomiting, and is beneficial if complicated with alcoholism.

4. Small repeated hypodermic injections of morphine, 1/6 or 1/8 gr., are more useful in insuring quietness to excitable and delirious cases, but it may mask all symptoms of intracranial pre-hemorrhage and is of no value to patients in coma.

5. Drastic cathartics are contra-indicated in shock, and when the patient is unconscious, daily soap suds enemas are very beneficial and may lower the blood pressure 10 to 15 degrees. Vigorous catharsis may be indicated later.

6. An ice bag surrounding the head is empirical, and may in a small way lessen cerebral circulation. Its value, however, in cases of extreme oncoming edema of the brain is questionable. Lister tubes themselves could hardly compete with the extensive inflammation. However, if the patient is conscious, the ice bag is very beneficial to relieve the throbbing pain in the head.

DRUGS

1. Ergot has been recommended to produce an anemia of the cerebral vessels. In severe cases, its action would be very meager. It may be of some value in mild cases.

2. Urotrophine is recommended by S. J. Crowe in his article in *The Johns Hopkins Bullitin, April,* 1909. It is supposed to render the cerebro spinal fluid bactericidal. It is used by very few surgeons now.

3. Iodides are said to produce a plastic exudation and encourage healing.

4. For restlessness and sleeplessness without pain, bromides, veronal and luminol may be given.

In fractures through the middle and anterior fossa, efforts to prevent infection should be made. The mouth should be kept clean. If there is a rupture of the tympanum, and discharge of the bloody cerebral fluid, the ear should be guarded against infection. It is customary to irrigate the external auditory meatus with antiseptic solution, and lightly close it with sterile gauze (5000 to 2000 mercury bichloride). Cases in which this is practiced, however, seem to do no better than those in which the ears are not treated. There may or may not be infected material on the outer surface of the tympanum—usually there is. If present, it is doubtful if it can be washed away by irrigation, while irrigation may drive it through the wound of the tympanum. The important matter is that the cerebro spinal fluid leaking out through the fracture into the middle ear, and then through the ruptured tympanum, shall have free escape.

If the current is continuously outward, infection and meningitis need not be feared, but aspiration of fluid that has once passed through the tympanum, back into the middle ear again, is of great danger. This condition is brought about by changes in the position of the patient turning the head with the injured side up, and by the outer canal becoming occluded by dried discharges. *Unless irrigation is done very carefully, there are positive dangers in it, and it is possible for an occlusive plugging of ears to be a decided menace.*

When the wound which made the fracture compound has healed, and cerebral fluid ceases to flow, the greatest danger has passed, but it not uncommonly happens that infection has already passed in, and is working its way to the meninges. These patients should be kept quiet until the symptoms have all disappeared. Usually, if there has not been much hemorrhage or exudation, this is a matter of about three weeks. The fracture may be regarded as healed in four or five weeks.

The average case of traumatism sufficient to produce a profound central hemorrhage of the brain is usually accompanied with a complete loss of consciousness, and makes but few localizing signs, so that one is forced to wait, much as in the type of apoplectic seizures. If hemorrhage extends into the ventricles, tapping and drainage may be attempted.

SUMMARY

1. Any scalp wounds which are the result of direct violence should be considered a potential skull fracture until proven otherwise.

2. Patients with skull fractures do not stand a general anesthetic well.

3. Cases of fracture of the base are poor operative risks.

4. When to operate:
   a. When a diagnosis of extradural hemorrhage is made.
   b. In severe oncoming edema of the brain.
   c. In depressed or compound depressed fracture of the skull.

5. When not to operate:
   a. In cases of fissure fracture without localizing symptoms.
   b. In the presence of shock.

6. The gravity of the injury depends upon the amount of damage to the brain substance

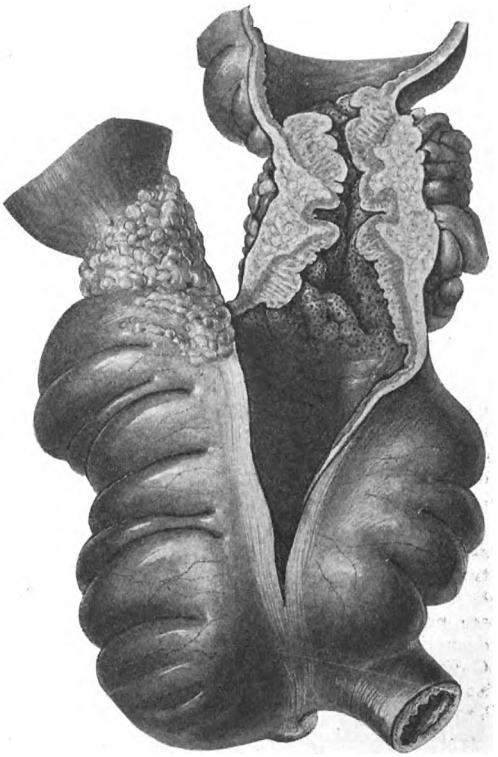
HYPERTROPHIC ILEOCECAL TUBERCULOSIS*

WITH REPORT OF CASE SUCCESSFULLY OPERATED ON



WALTER H. BAKER, M.D.
AND
M. W. LYON, JR., M.D.
SOUTH BEND

Hypertrophic or, as it is also called, hyperplastic ileocecal tuberculosis designates an unusual but not particularly rare form of intestinal tuberculosis distinguished in addition to more or less evident characters of tuberculosis by marked connective tissue formation, great thickening of the gut wall simulating a neoplasm and narrowing of the gut lumen. The condition is usually treated of in most works on surgery and on pathology, but cases are comparatively rarely seen as judged by published reports. The case here reported is the first that has come to our personal notice. American literature contains records of about 75 cases. In European literature reports of cases are more numerous, Hartmann in 1907 analyzing 229 operations. Many cases are probably hidden in writings dealing with general abdominal surgery such as W. J. Mayo's eleven cases, and so have escaped bibliographers.

The earliest published records which we have found referring to the condition are those of Czerny, 1889, Durante, 1889, Fink, 1890, and Billroth, 1891. Undoubtedly the condition had been seen before but had been unrecognized as tuberculosis, being probably interpreted as a true neoplasm. Probably some surgeons of 25 to 30 years ago have operated on the condition with the mistaken idea that a neoplasm had been removed and the patient cured of a malignancy instead of an infectious process.

The etiology of ileocecal hypertrophic tuberculosis is the same as that of any other form of intestinal tuberculosis, the lesion occurring in the same portion of the gut as the more commonly found ulcerations. A concomitant pulmonary or other form of tuberculosis may sometimes be associated with the lesion, but in most reports it is said to be absent or else is not mentioned, implying that if present, at least it was not conspicuous. It is probable that the hypertrophic form of ileocecal tuberculosis represents a special resistance to tuberculosis on the part of the patient. The general absence or at least inconspicuousness of pulmonary or other forms of tuberculosis in these patients indicates that their resistance to tuberculosis is good. Several authors have referred to the difficulty of finding tubercle bacilli in the lesions. We demonstrated them in our own case, but did not find them abundant. In the majority of cases reported, the disease appears to be primary, but it is not unlikely that if a thorough examination had been made or could have been made, old or latent lesions might have been found elsewhere. Many of the cases operated upon have developed pulmonary or other forms of tuberculosis later.

The gross appearance of a typical example of hyperplastic ileocecal tuberculosis is so well shown in the illustration of the case here presented that no detailed description is necessary.

Drawing by Aitken
Cecal Hyperplastic Tuberculosis
(Drawing taken from fresh specimen as removed).

The neoplastic-like structure is firm and rather hard. The lumen of the gut is all but obliterated. No areas of softening are present. Not all cases are so uniformly hyperplastic. Authors report cases in which much softening and abscess formation have occurred and even perforation of the gut wall. The lymph nodes adjacent to the lesion nearly always show tubercular

*Presented before the Section on Surgery of the Indiana State Medical Association, Indianapolis session, September, 1921.

changes, and evidence of tubercular peritonitis is nearly always present. In the case here reported small tubercles were present on the cecum, and the adjacent lymph nodes were enlarged and tubercular. Bacilli were demonstrated in the latter. The most common site of the lesion is about the cecum or just distal to it. Sometimes it is so far removed as the hepatic flexure of the colon. Much less often the ileum contains the lesion. The lesion is ordinarily solitary, but Hartmann illustrates one case in which as many as three distinct lesions were present in the colon.

Microscopically the lesion is characterized by marked connective tissue increase in the submucosa, the muscularis and the serosa. There is much small round cell infiltration, an abundance of epithelioid cells, and scattered single or multiple tubercles with giant cells. In our case distinct tubercles while present were not abundant, but the fibrous tissue formation and epithelioid and round cell infiltration were marked. The mucosa is not often affected. In our case it was uninvolved. Scattered tubercles or groups of them are of frequent occurrence in the serosa and adjacent portions of the gut. In our case many small tubercles were found beneath the serosa of the cecum. These do not appear in the illustration. The lymph nodes in the drainage area of the lesion are hypertrophied and contain tubercles. The lymph nodes in our case showed tuberculous lesions but without evident caseation.

Hypertrophic ileocecal tuberculosis occurs with about equal frequency in the two sexes. Of 217 cases tabulated by Hartmann 105 were males and 112 females. Of 81 cases listed by Crowder 39 were males and 42 females. The slightly greater incidence of females is probably associated with the slightly greater incidence of females in the average population.

The most frequent age incidence for hyperplastic ileocecal tuberculosis is between 21 and 40, about 62.5 percent occurring during these two decades. No cases are reported during the first decade. About 12.5 percent occur in the second decade and the remaining 25 percent occurring in the fourth, fifth, and later decades. Gage and Hunt's patient of 71 years, male, appears to be one of the oldest reported.

The clinical diagnosis of hyperplastic ileocecal tuberculosis appears to be difficult. In reports of cases the preoperative diagnosis is seldom stated. We do not recall that any author has made a definite clinical diagnosis of hyperplastic ileocecal tuberculosis. The diagnosis of appendicitis as in our own case has been made, as well as carcinoma. Hartmann in 1908 says: "An absolute *diagnosis* is usually impossible". W. J. Mayo (p. 256) says: "Eleven of the resections were for hypertrophic tuberculosis with well marked tumor, and in the majority it was difficult to differentiate them from carcinoma at the time of operation"; and (p. 260) "The hypertrophic type of tuberculosis, which gives rise to an infected tumor and cannot be differentiated from cancer except with a microscope." The usually earlier age incidence of hyperplastic ileocecal tuberculosis and a possible antecedent or concomitant tuberculosis elsewhere would appear to be the only means of differentiating clinically the condition from carcinoma of the same region. In addition to chronic forms of appendicitis it may be mistaken for diseases of the right kidney, ureter, and female organs of generation. The symptoms incident to a narrowing of the gut should be of value. Administration of a barium meal for roentgenologic examination would appear to be a dangerous procedure in a case with as much narrowing as in the one reported. An enema, used in the present case, should be without danger and prove of diagnostic value. The slight elevation of temperature reported in some cases is of little diagnostic import, but one would not expect to find it in carcinoma. The condition is so rare in comparison with diseases with which it may be readily confused that the diagnosis for the most part will probably rest with the surgeon at time of operation and with the pathologist.

The treatment of hypertrophic ileocecal tuberculosis is entirely surgical. The most favored operation is resection of the affected portions of the intestines and the mesentery associated with them and a lateral union of ileum and colon. A few operators have performed ileostomy, or ileocolonic anastomosis, with resection at a later period. In Hartmann's summary of 229 cases operated on, 137 had complete or partial resection and anastomosis at time of first operation. The average immediate mortality of the entire series was 20 percent. Many subsequent deaths occurred from pulmonary, intestinal, or peritoneal forms of tuberculosis. Hartmann, 1908, outlines the treatment as follows: "The ideal treatment consists in resection, for alone it surely does away with the tuberculous focus. Unfortunately it is not always possible, owing to the patient's general condition prohibiting a serious operation, or on account of local conditions (extensive and tough adhesions, disseminated tuberculous lesions of the peritoneum, involvement of numerous lymphatic glands, strictures widely distant one from another, etc.)". In the comparatively small number of American cases reported with sufficient detail, there was an immediate mortality of 10 percent or a little over. An additional 10 percent died subsequently of some other form of tuberculosis, occasionally dying of tuberculosis without leaving bed following the operation. The most successful series of cases is the eleven reported by W. J. Mayo with

no mortality. The later history of these patients is not stated. The case herewith reported has remained well up to the time of writing, a period of one year.

CASE REPORT. Male, 24 years, Jewish peddler, married, with three children, all living.

Complaint—Pain in right side of abdomen associated with vomiting and constipation.

Family History—Good, no tuberculosis, no cancer.

Personal History—Always been well as rule, usual diseases of childhood, works hard, only rarely sick with colds and minor ailments. Never constipated until recently.

Present Illness—April, 1920, first noticed constipation, began to have sudden cramping abdominal pains, mostly above the umbilicus and more in the midline than to either side, associated with nausea and vomiting. Says he had no fever, took cathartics without relief. At first attack consulted a physician, who diagnosed appendicitis and advised operation. Had subsequent attacks. On May 6 during one of these attacks consulted the senior author.

Physical Examination—Man of small stature, but looks strong, does not appear sick, but has a pinched, nervous expression. Says he has not lost weight. Temperature 98° F.

Oral cavity: Negative except for a few carious teeth.

Throat: Negative.

Chest: Negative.

Abdomen: Walls strong and muscular, not distended in one part more than in another. A hard mass with rigidity of the muscles and moderate but not excessive tenderness about 2.5 inches to right of umbilicus. Mass was not movable and could not be palpated by finger in rectum. No tenderness, no other masses in other parts of abdomen.

Diagnosis—Appendiceal abscess.

Operation and Findings—May 6, 1920, through an extended incision, a mass of about the size of a lemon, with the omentum about it was revealed. It was very hard but was easily moved about with the colon. It was located about 2 inches above the ileocecal valve. There was no pathological involvement of the surrounding tissues except two enlarged lymph nodes about the size of a filbert in the omentum near the attachment by adhesions to the mass. Except for these few adhesions of the omentum about the mass there were no adhesions in the abdomen. The appendix was normal. Having no permission from the patient or family to remove more than the appendix, this organ was removed and the abdomen closed. The mass was diagnosed as malignancy of the colon. The patient made an uneventful recovery. Permission was later obtained to do a resection of the mass. On June 15, 1920, a second operation was done. Distal portion of ileum, cecum and proximal portion of colon were excised and the ileum united with the colon by lateral anastomosis. From this second operation the patient made an uneventful recovery and at time of writing, one year later, is in good health.

Laboratory Findings—June 9, 1920. Wassermann reaction negative with plain and cholesterolized antigens. Roentgenologic examination of the colon by barium enema shows descending portion below splenic flexure partially filled, probably due to gas accumulation, transverse portion completely filled, and with normal haustration. At the junction of transverse portion with hepatic flexure there is an apparent obstruction and no filling of the first portion.

Macroscopic Findings of Removed Mass—Specimen consists of 75 mm. of normal ileum, a nearly normal cecum (on parts of it are small, 1 to 3 or 4 mm. slightly elevated tubercle-like bodies and it shows a recent appendectomy scar with suture still in place) and 300 mm. of colon above the ileocecal valve. The greater portion of the colon is normal in appearance except that 100 mm. above the valve there is a marked constriction, 40 mm. in length. The lumen of the constricted portion is from 2 to 5 mm. in diameter, the thickness of the gut wall is firm and apparently infiltrated with a firm whitish growth, streaked with reddish. A few small, scarcely enlarged lymph nodes are loosely attached to the colon in the vicinity of the constriction. (See illustration.)

Microscopic Findings of Removed Mass—The mucosa shows no essential pathologic changes. The lymphoid tissue of the submucosa contains a few characteristic tubercles. The outer portion of the submucosa and the part corresponding to the inner muscular fibers shows much well developed fibrous tissue in bands running in various directions and enclosing more or less circular masses of lymphoid cells, or else small collections of tubercles. The outer muscle fibers are invaded by a few lymphocytes and a few tubercles. The serosa shows considerable fibrous tissue and a few tubercles. Sections of the lymph nodes associated with the colon near the stricture contain many tubercles. Sections of the gut, and of the lymph nodes stained by Spengler's method show a few acid-fast bacilli in the lymph nodes and a few in the tubercles of the lesion of the gut.

Summary—Hypertrophic ileocecal tuberculosis is a well defined pathologic entity, characterized by tubercular tissue having marked connective tissue increase, attacking the gut usually about the cecum or just beyond, or the ileum near the cecum, as a single lesion, rarely more than one, causing marked narrowing of the lumen and having a strong macroscopic resemblance to a neoplasm Clinically it is recognized with difficulty, a positive diagnosis usually being made by microscopic examination only. The

treatment is surgical with resection of the diseased portion of the gut and lateral anastomosis of the severed portions. The immediate postoperative mortality is about 10 percent; while probably an additional 10 per cent die of some acute form of tuberculosis. A typical case with operation and recovery is reported.

REFERENCES

The following is a list of all the references which we have found available and have consulted. It is not a complete bibliography as we have found many references in works which have been unavailable. The list probably contains the most important references on the subject of hypertrophic ileocecal tuberculosis.

DISCUSSION

DR. J. H. EBERWEIN (Indianapolis): This condition attracted little attention until twenty-five years ago, although a localized tubercular deposit causing thickening of the coats of the cecum had been pointed out as long ago as 1849. Czerny of Germany and Durante of Italy made excisions of tubercular ceca some thirty years ago, but the real interest in the condition began in 1891 when Billroth in Vienna and Hartmann and Pillet in Paris announced that what had often passed as cancer of the cecum was really tuberculosis, capable of excision with prospect of permanent relief.

Most writers consider two varieties of cecal tuberculosis—the ulcerocaseous and the hypertrophic. Demonlin at Paris in 1905 pointed out the existence of an ulcerative form, a hypertrophic form and an enteroperitoneal form. As Hartmann says, the whole of the ileocecal region is lost in the ulcerative form, interspersed

with caseous matter and even purulent tuberculous cavities communicating sometimes with the intestinal tract. This condition is relieved by exclusion through anastomosis. The hypertrophic form is the so-caled tubercular tumor of the cecum. It is usually more or less mobile in the iliac fossa, and is often included in a fibro-adipose mass which attains a thickness of 3 or 4 cm. It is of much interest because so often mistaken for carcinoma, and because it is so amenable to surgical treatment.

In the etiology most writers state the probability of its being primary, but I noticed in the case reports that the physical examination shows lungs normal, except some slight dullness, a few rales or rubs at the base, etc. It is my opinion that later we will discover it is nearly always secondary to pulmonary tuberculosis.

Pathology:—The condition usually involves the cecum, sometimes a part of the ileum, but may involve any other part of the colon. There may be one tumor or more. It has been necessary to remove the whole colon to get a cure. In Dr. Baker's report the condition seemed to involve more the serosa and subsera, and the mucosa was not involved. Vegetation and polypoid masses may form in the lumen of the cecum. One assumption is that the tubercle bacilli pass through the intact wall of the intestine, usually the ileum, without leaving any trace of their passage, and enter the mesenteric and retroperitoneal lymph nodes, giving rise to symptoms of tuberculosis of these structures.

Symptomatology:—In the incipient stage there are indefinite gastro-intestinal symptoms accompanied by pain and tenderness in the lower abdominal quadrant. In the second stage we find a readily palpable and movable cecal tumor with symptoms of a low grade localized abdominal inflammation. In these two stages fever may or may not be present. In the third stage symptoms of obstruction dominate. An x-ray examination should always be made, excepting where acute obstructive symptoms are present.

The treatment is both medical and surgical. These cases should be treated medically both before and after operation and given practically the same medical treatment as other forms of tuberculosis. Heliotherapy should be used both before and after operation. There are some differences of opinion as to surgical treatment. Although most men prefer excision and anastomosis, as was done by Dr. Baker, some prefer ileocolostomy with or without intestinal exclusion in the majority of cases; first, because the mortality is greater in excision than in simple ileocolostomy, and second because the latter will cure most cases. Intestinal exclusion is combined with the ileocolostomy where the disease involves a great deal of the gut wall. If the disease is still more extensive, ileosigmoidostomy can be performed as advocated by Lane.

DR. A. S. JAEGER (Indianapolis): As the doctor says, many of these cases are diagnosed as chronic appendicitis with adhesions, and this paper will make us remember that at times it is best not to make absolute preoperative diagnosis, because we have all had the experience of sometimes not finding things in the belly as they seem to be from the outside.

I believe Dr. Baker has been taught a valuable lesson in that I do not believe in future he will operate a case with permission simply to do one thing. It has been many years since I have operated anyone unless I have had consent to do that which I found best and necessary to do. If Dr. Baker had operated this case with consent to do whatever he could do, he would not have had to operate the second time. So it behooves us to get the practical points from his paper as well as the scientific points.

DR. JOHN W. SLUSS (Indianapolis): I have seen three cases of tuberculosis of the cecum, all occurring in my service at the City Hospital. They were all in foreign-born individuals, and I had a very strong impression from my study of these cases that diet had a great deal to do with the development of the condition, because these individuals whom I saw had lived upon a very indifferent sort of diet, and I thought their mode of life together with their diet had much to do with the origin of the disease. In other words, that the cecum acted as a sort of trap, a sort of cesspool, which gave the tubercle a chance to develop and take hold upon the mucosa of the cecum.

My opinion, further, is that these cases were nearly all primary in the cecum. That is, that hypertrophic tuberculosis of the cecum is merely an end process, and that the trouble begins as a simple ulceration of the cecum; that it is not an active process; that it develops very slowly, and the attempt of nature to circumscribe it and wall it off results in the formation of a great amount of scar tissue, so that the connective tissue formation is merely one of the end results of the ulcerative process. The surprising thing in these cases I have seen—I have operated only one myself—was the motility of the tumor, which has been mentioned by the essayist. One would expect that with a process which has manifestly continued so long and which involves such an extensive part of the abdomen, there would be extensive adhesions; but usually the tumor is quite motile and there is no difficulty in the excision.

I want to emphasize the fact that in my opinion the trouble is local in its origin, and that there is not necessarily a primary focus in some other part of the body.

DR. B. VAN SWERINGEN (Fort Wayne): I want to refer to a case in the hospital now in which the diagnosis before operation was cecal

tuberculosis. The patient was a young girl about nineteen years of age who had lost considerably in weight recently; within the last few months she had lost twenty pounds. The symptoms were those of general weakness, with the exception of a diarrhea which had persisted for two months, following a sojourn at a little lake in the northern part of the state, which it was thought was due to improper food. However, the apparent anemia, the loss of weight, and a temperature of 101 to 101.5 led us to suspect tuberculosis immediately. There was no cough, but on examination of the chest there were a few rales on one side and some impairment of the percussion note with enough harshness of the respiratory murmur to make a chest expert suspect very strongly that there was a pulmonary lesion. However, examination of the little sputum we were able to collect was negative. While she was under observation she passed a little blood in the urine a time or two. Examination of a centrifugalized specimen revealed acid fast bacilli in the urine. There was a mass in the right side of the abdomen corresponding to the mass often felt in appendiceal disease, especially acute appendicitis with adhesions. She was operated a few days ago and the tuberculous infection was found to be in the ileum, not the cecum. The appendix was not diseased, but the process extended up at least six inches on the ileum and away from the appendix, not on the side of the large bowel at all. There was no involvement of the wall of the cecum.

I simply mention this to show that "tuberculosis of the cecum" may be found in the small gut.

DR. GOETHE LINK (Indianapolis): It has been my fortune to meet with two cases of tuberculosis of the cecum, a condition which looks very much like cancer. We find, however, that in tuberculosis of the cecum there is usually no increase in peritoneal fluid, while in carcinoma there is always a great increase in peritoneal fluid. That will help us in making a diagnosis, for it must be made on the spot and usually from the gross appearance. In my cases there was not sufficient obstruction to demand resection and I removed the appendix and closed the abdomen. The patients were then sent to a southern climate and treated as if they were suffernig from pulmonary tuberculosis, and both recovered.

In view of the large mortality percentage from the surgical treatment of this condition, it is my opinion that unless the gut is so damaged as to cause obstruction, this condition should be treated medically and not surgically.

DR. W. H. WILLIAMS (Lebanon): A short time ago a young man came under my observation with an abdominal condition for which he had been previously operated. He was thirty-three years of age. About five months before I saw him he had been operated under another service for appendicitis. While in the hospital following this operation he seemed to do very well, but after going home his old symptoms returned—pain in the umbilical region with more or less disturbance of digestion and a general feeling of illness. No temperature present, no abdominal fluid, and but slight loss of weight. Finally he came into our service and upon examination I found an elongated mass in the right side extending well up to the edge of the liver. An examination of the lungs did not reveal any pulmonary condition, so we decided that we would make an exploratory incision and see whether or not that was a tubercular mass. That was done. We found tubercular involvement of the cecum extending almost to the hepatic flexure, and extending out on the ileum for a distance of twelve inches. We thought with that condition we could not make an anastomosis nor remove the cecum and that part of the ileum involved, so we simply closed the abdomen and followed with general treatment. He seemed to improve for about four weeks, had a good appetite and gained some flesh, but he soon dropped back to the same old train of symptoms, and immediately following that, pulmonary symptoms presented, and between three and four months after operation he died—a typical case of pulmonary tuberculosis.

DR. WALTER H. BAKER (closing): As has been said, the question of diagnosis from the gross specimen as the surgeon views it, with the abdomen open before him, is very difficult to differentiate from cancer. Yet the following points in my case and in the report of other cases should be considered:

The cecum is mobile, quite freely so, mass and all.

There was a lack of free fluid in the peritoneal cavity.

Localization of the disease seemed more marked than in malignancy. There may be other points brought up from a more careful and accumulative study of cases, over years of time, that will make it possible for us to make a positive diagnosis before operation. This we all hope for.

As I listened to the discussion I could not help but wonder how many cases of hyperplastic ileocecal tuberculosis had been removed for cancer and a recovery followed, and a cure charged up to the surgery of cancer. Likewise how many such growths had been left *in situ* and the death charged to malignancy. This subject therefore is well worth our most careful attention.

EDITORIALS

THE DEATH OF DR. WYNN

For the third time within the last few months the Indiana medical profession loses one of its most prominent members through the tragic death of Dr. Frank B. Wynn, of Indianapolis, which occurred in the mountains of Glacier Park, Montana, on July 27. No Indiana physician stood higher in the esteem of the medical profession and his fellow citizens than Dr. Wynn, and his loss will be felt by innumerable activities which received his attention. His name was identified with many civic movements, though at no time did he lose sight of professional affairs as was evidenced by his connection with medical societies every one of which signally honored him, and with the Indiana University School of Medicine in which he long occupied a prominent position as teacher. It was his love of nature and interest in outdoor recreations that led him many years ago to join the American Society of Mountain Climbers, and it was his indulgence in the pastime of that society which finally led to his tragic death. One of his early achievements which brought him distinction in the medical world was the creation of the Scientific Exhibit of the Indiana State Medical Association. It was the general excellence of this work which finally led the American Medical Association to establish as a permanent feature of annual sessions a Scientific Exhibit over which for many years Dr. Wynn presided with signal honor to himself and great benefit to the physicians of the country. He had been honored by numerous societies, which included the presidency of the Indiana State Medical Association, the Indianapolis Medical Society, the Mississippi Valley Medical Association, and first vice-presidency of the American Medical Association. He also had served as president of the American Mountain Climbing Club, the Indiana Centennial Commission, and numerous other civic, professional and social organizations. He was the author of many valuable scientific papers and at the time of his death had just completed a series of articles on "The Physician" which had been running regularly in this Journal throughout the past two years. In fact it was immediately prior to his departure for the West where he met his tragic death that he completed arrangements for the publication in book form of this series of articles. As a practitioner of medicine he was singularly successful. For many years he limited his practice to internal medicine and enjoyed a large consultation practice. His patients learned to love him not only because of his scientific ability but because of his very lovable and sympathetic disposition, and medical men everywhere held him in the highest esteem. His untimely death at sixty-two years of age creates a loss which it is hard to fill, and as we had occasion to say at the time of the tragic death of another prominent physician, "the medical profession has lost one of its truly great men".

HAY FEVER

The vast army of hay fever victims has looked to the medical profession for years to bring them some relief, and there is gradually accumulating evidence that their hope has not been without foundation. The road to their improvement was opened by studies in allergy which showed these conditions to be expression of human hypersensitiveness. Their treatment by gradual immunization naturally followed forthwith, and its results while far from perfect augur well for ultimate success.

The use of the various pollen extracts, polyvalent or univalent, is now more than ten years old and the number of cases treated furnish statistics worthy of consideration. In the reports of 8,000 cases, collected from various sources, approximately 25 percent are said to be entirely relieved, 50 percent made comfortable, and the remaining 25 percent not materially relieved if at all. As a general procedure timothy pollen may be used for the "spring" type and ragweed for the "fall". Many prefer the polyvalent extracts in both cases, but the fact is that either because of their more common occurrence or because of their greater activity the two mentioned cause the vast majority of hay fever cases.

Immunization should be begun early, the injections being given at five-day intervals and so timed that the maximum dose is reached shortly before the individual's "season" begins and then continued through the season at ten day intervals. Reactions to the extract are rarely of any consequence and may be controlled readily by epinephrin when necessary.

Failure to immunize the first year should not discourage one, for it is frequently possible to obtain the desired result by perseverance throughout the second or even third year. On the other hand, permanent immunization should never be promised the hay fever victim, for relapse in apparently immunized patients frequently occurs. Hay fever patients frequently

"outgrow" the disease, *i. e.*, immunize themselves, and it is best to continue the process of immunization yearly until such fortunate outcome may be reasonably hoped for.

One of the early obstacles to the success of this method of treatment was the instability of pollen extracts. This, luckily, has been overcome, and extracts potent for six months are obtainable. At first glance it would seem wise to employ only freshly prepared extracts, but the published statistics show little if any difference in the results of cases treated by freshly prepared extracts and those prepared commercially.

Explanation of the resistant cases is still lacking, for many of them do not seem to differ in any respect from those most successfully treated. Greater experience in the graduation of doses, in determining the intervals between injections, and possibly greater familiarity with the wide variety of inimical substances to which the human animal may be hypersensitive, will eventually add the unsuccessfully treated to the list of those entirely relieved.

SUPPORT THE COUNCIL ON PHARMACY AND CHEMISTRY

As evidence that doctors are easily duped we cite the following incident which we know to be true:

Very recently a representative of a comparatively little-known firm, manufacturing pharmaceutical specialties, has been calling upon the Indiana doctors and leaving samples of a pharmaceutical specialty that has *not* received the approval of the Council on Pharmacy and Chemistry of the A. M. A. In fact the preparation, of unknown formula, has all the ear marks of being worthless, and like all preparations of that kind is sold at an extravagant price. The representative who is calling on the Indiana doctors does not hesitate to say that his firm has absolutely no use for the Council on Pharmacy and Chemistry of the A. M. A., and that the doctors should pay no attention to the Council's findings. As an evidence that doctors are listening to this talk, we happen to know that many are prescribing this preparation of unknown formula; and probably worthless, and the agent is boasting of this fact—all of which leads us to remark that when doctors persist in being so gullible, to say nothing of being so inconsistent in the practice of their profession, is it any wonder if the people lose confidence!

In the first place, no doctor is justified in prescribing a preparation, the character and ingredients of which are unknown to him. In the second place, even the published formula does not always tally with the real formula, proof of which has been determined many times. The Council on Pharmacy and Chemistry of the A. M. A. is a clearing house for the medical profession, and its findings are not only unbiased but thoroughly dependable. Not only should the medical profession support the Council, but it should be guided in every instance by the Council's findings. The doctor who follows the dictates of a pharmaceutical house, which ordinarily has no more interest in the medical profession than that which brings in dollars and cents, is untrue to his professional calling. When he prescribes preparations of secret formula, and the merits of which he knows nothing, he stoops to the plane of the quack. The American Medical Association has furnished a safeguard by establishing the Council on Pharmacy and Chemistry, and every doctor who prides himself upon being rational and honest in the practice of his profession ought to appreciate the efforts of the Council in affording him protection, and be guided by the findings of that body. Whenever a glib salesman offers a proprietary preparation, the first question asked should be, "Has the preparation been approved by the Council?" If the salesman or detail man admits that the preparation is not approved, then refuse to have anything to do with it. On the other hand, if the claim is made that the preparation has been approved by the Council, make sure that the man is not lying about the matter, as it is a well-known fact that some detail men claim that certain preparations have passed the Council when such is not the case.

"LE CADUCEE"

London's medical profession has been perturbed by an English version of the remarkable play to which Baron Henri de Rothschild, under his pen name of André Pascal, has given the title "Le Caducee." The central figure of the play, one Dr. Armand Revard, is a fee-splitting surgeon who, of course, performs unnecessary operations for the sake of a fee. Revard, like his American prototype, craves notoriety and invites newspaper representatives to his operations. One of Revard's victims is an American woman who dies. Threatened with exposure and learning that the patient he has killed secretly loved him the charlatan commits suicide. Ethical medicine is represented in the play by two decent doctors who give voice to the high principals of our profession. The English title of the piece is "The Risk." The following illuminating comment on the French title occurred in the *London Telegraph*:

In the French version it is "Le Caducée", which requires explanation, and therefore fails to be striking or suggestive. The Caduceus is the emblem of Aesculapius, the god of all doctors, and the serpent which winds itself around the emblem typifies Prudence and Caution, while the mirror into which it looks is, of course, Truth. But there is another Caduceus which is the emblem of Mercury—a very different god, the patron of commerce and also of

those arts, not always above board or honest, which commerce brings in its train. Naturally, the identification of the two leads to some confusion among both the profession and the public at large. The devotees of Mercury worship a different ideal from that which appeals to the disciples of Aesculapius. The one set laughs at the other as out of date, the second charges the first with dishonesty.

A play which could teach the above lesson to the critic of the *Telegraph* deserves the applause and the encouragement of reputable medical men. The JOURNAL has no patience with such protests as the *British Medical Journal* made against its production. The play is not an attack upon the medical profession but it is an attack upon some of our unscrupulous members. The notoriety seeking fee-splitter is indigenous to American soil, but he flourishes in France and Great Britian as well. Baron Rothschild is a physician as is also the London producer and actor, Arthur Bourchier. These gentlemen deserve credit for having focused the attention of the public on the fact that the commercialization of medicine is of grave public concern. It is coming to the time when the wise patient will find out whether his physician is working under the caduceus of Aesculapius or under the emblem of Mercury.

EDITORIAL NOTES

DEAR DOCTOR:

THE JOURNAL and the Cooperative Medical Advertising Bureau of Chicago maintain a Service Department to answer inquiries from you about pharmaceuticals, surgical instruments and other manufactured products, such as soaps, clothing, automobiles, etc., which you may need in your home, office, sanitarium or hospital.

We invite and urge you to use this Service.

It is absolutely FREE to you.

The Cooperative Bureau is equipped with catalogues and price lists of manufacturers, and can supply you information by return mail.

Perhaps you want a certain kind of instrument which is not advertised in THE JOURNAL, and do not know where to secure it; or do not know where to obtain some automobile supplies you need. This Service Bureau will give you the information.

Whenever possible, the goods will be advertised in our pages; but if they are not, we urge you to ask THE JOURNAL about them, or write direct to the Cooperative Medical Advertising Bureau, 535 N. Dearborn St., Chicago, Illinois.

We want THE JOURNAL to serve YOU.

REMEMBER that the next session of the Indiana State Medical Association will be held in Muncie, on Wednesday, Thursday and Friday, September 27, 28 and 29, 1922.

THE village of Waymansville, Indiana, is without a physician since the recent departure of Dr. F. W. Kern for Cincinnati, where he entered government service. The location is a good one, and any interested doctor should communicate with Wm. Otte, Waymansville.

THE preliminary program of the Muncie Session of the Indiana State Medical Association is published in this issue of THE JOURNAL. The completed official program will appear in the September number. We hope that every member of the Association will have the official program a week before the Muncie session.

THROUGH an error on the part of our printers an insufficient number of copies of the July issue of THE JOURNAL were printed, and our files are practically depleted for that month. Therefore, if doctors who do not bind their copies to keep permanently will send in their July copies to this office, the courtesy will be greatly appreciated and we shall be pleased to furnish postage.

WE have received a cynical and sarcastic anonymous letter concerning the question of unethical advertising on the part of physicians which the writer says he hopes we will have the "guts" to publish. He admits mailing his letter away from home in order to avoid identification. We shall take great pleasure in publishing the letter if the writer will have the "guts" to give his name (not necessarily for publication) and not resort to "thief in the night" tactics in order to vent his feelings.

OUR readers know of a well known advertising slogan, "Good morning! Have you used P——'s Soap?" We desire to improve upon it by saying, "Good morning! Have you read the advertising in THE JOURNAL?" Remember that the busy housewife learns of bargains at the department stores by reading the advertising in the daily papers. You may or may not strike bargains by reading the advertising pages in your JOURNAL, but you certainly will profit by learning something that is of interest to you.

This is the time of year when doctors are called upon to treat sick babies. Most of the ailments are digestive troubles, principally diarrhea of the fermentative type. Our readers should remember that one of our advertisers manufactures infant diet materials and the firm is one of the very few that does not advertise to the laity but depends upon patronage which comes through the recommendation of physicians. Their products advertised in the medical journals have the approval of the Council on Pharmacy and Chemistry of the A. M. A.

THE secretary of the Vigo County Medical Society is "onto his job", and among other activities is sending out a series of letters calling attention to some of the things which are threatening the medical profession of today. One of these letters significantly points to one of the "weak spots" in our profession and

that is the apathy and lack of co-operation among medical men in upholding educational standards and preventing iniquitous legislation pertaining to medical licensure. The suggestion offered is that it is time for medical men to get together.

SINCE the publication of our editorial in the July number of THE JOURNAL on the subject of unethical advertising on the part of physicians, we have been deluged with letters concerning the matter. Practically all of the letters approve the suggestion that the notorious offenders be brought to book, though some of the correspondents, cynically inclined, complain about the lack of ethical conduct on the part of all physicians. For lack of space it would be impossible to publish all of the contributions that have been sent in, even though permission to do so has been given, but we will publish some of the letters in the September number of THE JOURNAL.

THE New York State Department of Health is doing a splendid work in educating the public concerning health and sanitation. Not only are the "Radio Health Hints", broadcasted from the radio station at Schenectady, valuable as educating the public, but the newspapers throughout the country are furnished with weekly health notes of timely interest and we notice that for the most part newspapers are taking advantage of the service. This is a step in the right direction in educating the public along right lines concerning public health matters and the example set by the State of New York could well be followed by the boards of health in other states.

THE Indiana Tuberculosis Association is doing a commendable work in spreading propaganda concerning the dangers of accepting treatment at the hands of charlatans and quacks and following anything but expert advice in the management of diseases. Recently the Association has printed a pamphlet entitled "The Chiropractor in the Supreme Court", in which attention is called to the ignorance and inconsistency of the chiropractic teaching as well as to the necessity of the State exercising a legitimate right in taking a forceful stand for the protection of health by requiring that all those who take into their hands the lives of others be placed under the same requirements for practice as doctors of medicine. This pamphlet ought to be of some service in educating the incoming legislators.

"The business men of Chicago have secured the services of an expert in rat extermination work in order to reduce the danger and financial loss incident to the presence of rats.

"The health commissioner has endorsed this movement and promised cooperation. Federal authorities claim that there are as many rats as human beings in this country."—*Boston Medical and Surgical Journal*, August, 1922.

Perhaps in time the profession of rat extermination will become quite popular and respectable. We may even hear of pied pipers of legendary fame, and if the rats are susceptible to the strains of music why not set a phonograph at work in our alleys with records giving forth suitable rat music and entrap the rodents while we sleep. Anyhow, a rat crusade in the cities and thickly populated communities is deserving of approval, for there is no question about the fact that rats disseminate disease, to say nothing of destroying property. As a suggestion we might offer the recommendation that municipalities could accomplish a good deal by offering a bounty for rats, dead or alive, and thus give the small boy a chance.

THE Indiana State Division of the American College of Surgeons will hold a meeting in Evansville December 4 and 5, in which Michigan will join, as also will the Ohio Valley Medical Association. This is the second annual meeting of the Indiana Division, and the Evansville doctors are well organized and have splendid plans under way for a good program and clinic. The executive officers are James Y. Welborn, Chairman, Evansville; E. M. Shanklin, Secretary, Hammond; H. O. Bruggeman, Councilor, Fort Wayne. Committees appointed for the annual session are as follows: Committee on Arrangements, Wm. R. Davidson, Evansville; W. S. Ehrich, Evansville; E. M. Shanklin, Hammond; Bleeker Knapp, Evansville. Committee on Entertainment, Wm. H. Field, Evansville; J. W. Phares, Evansville; L. D. Brose, Evansville; J. Rilus Eastman, Indianapolis. Program Committee, M. Ravdin, Evansville; Wm. E. McCool, Evansville; Benjamin Floyd, Evansville; M. R. Combs, Terre Haute. Committee on Hospital Arrangements, J. Y. Welborn, Evansville; A. M. Hayden, Evansville; P. C. Rietz, Evansville; M. Ravdin, Evansville.

A FEW months ago we chronicled the tragic death of President Stone of Purdue University, who lost his life in the pastime of mountain climbing in the Glacier National Park. At that time we commented upon the fact that mountain climbing is a hazardous undertaking and that it seemed a pity that prominent men, in the prime of life, so much needed in carrying on the world's great achievements, should indulge in such a pastime with the possibility of losing life. At that time we were criticized by Dr. Frank B. Wynn for having placed mountain climbing in the list of dangerous activities, and the editor of THE JOURNAL, half in jest and half in earnest,

said that if one would keep at mountain climbing long enough he would meet with a serious mishap. It is but a few months since this remark was made, and now we are recording the tragic death of the one to whom the remark was made, for it is very probable that Dr. Wynn would have been alive today had he not attempted the scaling of the highest peaks in Glacier National Park. A tragic end is open to any of us, but it is not necessary for us to court danger, and mountain climbing, in the light of the history of the sport, must be considered a hazardous undertaking.

THE chiropractors are good advertisers. They not only use newspapers and billboards but they use their advertising on blotters, paper bags, fans and other useful articles that are distributed gratis to the public. We also have noted in last month's JOURNAL that the churches are worked to the limit to further chiropractic delusion. Probably the next thing will be for our ministers to include in their prayers something like the following: "And, good Lord, in bestowing thy blessings upon the president of the United States and other high personages, please do not forget the members of the chiropractic faith who promise to deliver the world from all physical infirmities and inflictions—yea, even to the growing of hair on the bald heads of the deacons in our churches—through the medium of simple mechanical manipulations. And, O Lord, we beseech Thee to pour your richest blessings down upon the heads of these wonderful benefactors." In reality this may not be so much of a joke either, for we shall not be surprised if more than one minister is deluded into offering such a praper in the sincere belief that he is increasing the chances of the sick and the maimed to become well.

THE Committee on Arrangements for the Muncie Session of the Indiana State Medical Association desire to call the attention of the golfers of the Association to the fact that there will be a Doctors' Tournament. They boast the best 18 hole course in Indiana—in fact in the West—at the Delaware Country Club, and their announcement reads as follows:

"Golfers, Attention. How about a 78 on the best 18 hole course in Indiana? Listen! The Delaware Country Club of Muncie has just opened a wonderful new 18 hole course, one of the best in the West, and they have very kindly allowed the use of it to the visiting members of the profession who are golfers and who will be present at the State Meeting in September. We are going to have a Doctors' Tournament. It will be more than likely a handicap, so we ask that you send in your name with your best scores (*of course*) as soon as possible to Dr. Frank G. Jackson, 214 East Adams street, Muncie, Indiana, or to Dr. C. A. Leatherman, care Muncie Products Division of the General Motors Corporation, Muncie. If there are any "Old Timers" who wish to play off an old score (*or pay an old debt*), just let us know the names and arrangements will be made. *"Dub"* foursomes will be the specialty, and we may have a keg of nails for the best score."

A FEW months ago we published an article calling attention to the unfair discrimination against American physicians by the teaching body of the University of Vienna. We are in receipt of a further communication, dated June 30, as follows: "The American Medical Association of Vienna wishes to have you announce through the columns of your Journal, the restoration of friendly understandings between their organization and the teaching body of the University of Vienna. A special committee, elected by the Association, after a thorough investigation of the charges of discrimination against Americans, which were reported by members of our Association and published in our recent memorandum to your Journal, find that the men who made the accusations of discrimination were either unable or unwilling to substantiate these charges under oath. Further, the courses in question were not so-called book courses and consequently were not under the control of the A. M. A. of Vienna. It is the sentiment of this Association that the men of the teaching body of the University of Vienna have suffered by this unjust criticism. We further wish to state that through the efforts of our special committee, working with a like committee from the teaching body, sufficient numbers of book courses in English in all branches may be had at prices of from $3.00 to $5.00 per hour for the group, taking such courses."

OUR hats are off to the Vigo County Medical Society! At present a series of letters are being mailed by the Society to doctors all over the State in which attention is called to some of the problems confronting the medical profession, not the least of which is the growing menace of State Medicine. The question of keeping up the standard for medical practice also is discussed intelligently and medical men are asked to take an active part in politics with a view of preventing the chiropractors from gaining any legal recognition as qualified practitioners of medicine. The plea is made to medical men to stand for fair play and a square deal on the question of recognition of the various cults that are now imposing upon the people and representing themselves as qualified to treat the sick and disabled when we know that they are notoriously incompetent. The legislature meets next

January and it is the duty of every county medical society to follow the suggestion of the Vigo County Medical Society and have the candidates for the legislature from each county appear before the medical society of that county and tell exactly where they stand on the question of support of the present medical practice acts. In one of the letters the final rejoinder is worth remembering: "Let's get some place and be somebody. Let's fight! If we are going to permit chiropractors and such to spend their money for legislation favorable to them without a fight, why not take to some other calling where there are no battles to fight?"

THE HIGHER EDUCATION OF CHIROPRACTORS. "What is your favorite light literature? Detective stories? Mystery stories? Humor? Have you ever read the publications issued by the various species and subspecies of the chiropractic cult—for there is, as you know, a lack of unanimity among the chiropractors. One particularly choice piece of contemporary journalism is issued by a chiropractor factory in Fort Wayne, Indiana. Its July, 1922, issue makes good hot weather reading. The editor discusses a "model bill," recently drawn up by those chiropractors of Indiana who belong to a different subspecies from those represented by the publication in question. This Fort Wayne journal views the bill with disfavor. It says, with refreshing naivete:

> To begin with, there is absolutely no need of a Chiropractic licensing and examining board in Indiana today. The existing lot of Chiropractors in Indiana cannot be improved upon. You are not being persecuted or prosecuted, you are left severely and strictly alone to practice your profession without let or hindrance from any source or any group of any kind. In fact, Indiana today is the best Chiropractic state in the entire country. Chiropractic conditions are as near ideal as it is humanly possible to approach that condition.

"But the fact that Indiana is the home of the free, chiropractically speaking, is not the only objection this journal has to the proposed bill. It seems that the bill would require applicants for chiropractic examination to submit satisfactory proof of the possession of a preliminary education, equal to that of a high school. Perish the thought! As the editor says:

> How many chiropractors in Indiana today could qualify under that rule? Of all the Chiropractors in Fort Wayne, I do not happen to know of ONE that is a high school graduate. In fact, I believe that the total number in Indiana able to comply with that ruling would be less than two per cent of all the Chiropractors in the State.

"From the point of view of the owner of a chiropractic 'college' the sentiments just quoted are eminently logical. It would be entirely unfair to chiropractic schools to insist on matriculants being educated human beings. What educated human being would ever attend a chiropractic school? Of course, from the point of view of public interest—but that's another story."—*Journal of the American Medical Association, July 15 '22.*

THE country now suffers from business depression and, of course, doctors along with other business and professional men feel the effects. A little more prolongation of the existing strikes, with perhaps the addition of a few more disturbances in labor circles, and this country is going to suffer some real want in the midst of plenty. Isn't it about time to put a stop to this foolishness of permitting a handful of arrogant men to cause a nation of over one hundred million people to suffer? Laborers and employers of laborers should be compelled to adjust their differences promptly when a cessation of their activities means suffering for the public. Arbitration is the fair and honorable way of settling disputes when warring parties can not settle their troubles among themselves, and we have no sympathy with laboring men when they refuse to arbitrate and insist that their demands shall be the only ones considered, as has been the case in some recent disturbances between laborers and their employers. On the other hand we have no sympathy for the employer who insists that he has a right to treat his employees as he sees fit. In the matter of furnishing such necessities as food, fuel, light, transportation, etc., the public has some rights which must be considered, and both employer and employee should be compelled to recognize this fact. At the present time there is good reason for using "the big stick" of Roosevelt on the warring factions, and we have been greatly disappointed in President Harding in noting that he has exercised altogether too conciliatory a spirit in attempts to relieve the country of actual suffering and want occasioned by the needless strikes connected with the mining and transportation business. We are not in sympathy with the idea that mining and railroad transportation of every kind should be controlled by the government. The good Lord deliver us from government owned railroads, for we have had a taste of that and it proved disastrous, such things are bound to be with the politics which would enter into such enterprises, but we are firmly convinced that the government should not only force mining and transportation companies and their employees to submit their controversies to arbitration but compel them to abide by the results. To permit them to continue a war to the bitter end is to compel the public, most vitally concerned in the outcome, to suffer unnecessarily, and it should be prevented. Such a course of action is inconsistent and should be prevented forcibly if necessary.

THE tragic death of Dr. Frank B. Wynn, beloved member of the medical profession of the state, has brought sadness to the heart of all who knew him. That his friends and colleagues may know the circumstances attending his death, we are publishing herewith, through the courtesy of Dr. W. N. Wishard, who was with Dr. Wynn's party at Glacier Park, the statement made by Dr. H. H. Goddard of Columbus, Ohio, who was with Dr. Wynn when the tragedy occurred.

FACTS CONCERNING THE DEATH OF DR. FRANK B. WYNN

On Siyeh Mountain, Glacier National Park, Montana, Thursday, July 27, 1922.

Dr. Wynn and I left Many Glacier Hotel about ten a. m. on Wednesday, purposing to camp near the top of Piegan Pass and climb Mt. Siyeh on the morrow. We carried our sleeping bags and food on our backs. We traveled slowly and enjoyed the trip. We lunched near Morning Eagle Falls, took some pictures and ascended the Pass.

We arrived about four p. m. and made camp a few rods below the summit of the Pass. After a comfortable night we rose about daybreak and prepared breakfast. At five forty-five we started for Siyeh. We left the trail about on a level with the saddle between Cataract Mountain and the Siyeh Range. Reaching the saddle, Dr. Wynn took some pictures and we proceeded to ascend toward the visible summit. The rocks were good and we hoped to reach the high slope and also the afore mentioned summit.

Dr. Wynn was in excellent spirits and said this was just the kind of climbing he liked. We picked our way but found no difficulty and no dangerous places. Dr. Wynn was leading. He came to a point where he said, "I don't know which is the better way—to go along the rocks nearly horizontal or to climb up to the next shelf." He chose the latter. The horizontal way was entirely feasible, as I could see. I could not see the other as I was a few feet below him and to the left, but he evidently thought it better to climb up to the next shelf. He put his knee on the rock and seemed to start up. I was about to step to where he had been standing when he seemed to step back and the next instant fell headlong backwards to the shelf below—perhaps six feet down. He rolled off this and on down the mountain for quite a distance.

In my judgment he must have had a sudden physical disturbance, probably apoplexy. He could not have slipped, because there was no difficulty to cause a slip, and had he done so he would have easily recovered himself, or at the worst would have slid down feet first clutching at the rocks. He made no sign of an effort to save himself. He uttered no sound. I was looking at him all of the time and jumped to help, but could not reach him—so quick was the movement. Moreover, he had let go his ice axe, which he almost certainly would not have done had he been conscious, as it would have been his greatest aid to recovery.

I at once descended to where he lay on the rocks. He was not breathing nor was there any pulse or other sign of life. I arranged the body slightly and hastened to Many Glacier Hotel for help. I reached there at eleven a. m. The tragedy occurred at seven-thirty a. m.

A party was sent out at once and the body recovered as promptly as the difficulties would permit.

I have climbed with Dr. Wynn now for two years. He was an excellent mountaineer—always cautious and using good judgment. He took no risks. This also makes me certain that this was not a mountaineering accident, but rather a sudden physical seizure of some kind.

(Signed) HENRY H. GODDARD.

Many Glacier Hotel,
Thursday, July 27th, 1922.

DEATHS

STELLA E. HALL, wife of Dr. J. E. Hall, of Alexandria, died May 23 at the age of forty-five years, death resulting from influenza.

LAUGHLIN O. MALSBURY, M.D., of Peru, died in Chicago, July 4, at the age of fifty-five years. Dr. Malsbury graduated from the Kentucky School of Medicine, Louisville, in 1891. He was a member of the Indiana State Medical Association and the American Medical Association.

FRANK W. GARRETT, M.D., of Liberty Center, died July 17 at the age of sixty-seven years. Dr. Garrett graduated from the Medical College of Indiana, Indianapolis, in 1882. He was a member of the Wells County Medical Society, the Indiana State Medical Association and the American Medical Association.

FRANK B. WYNN, M.D., of Indianapolis, a leader among medical men of Indiana, and nationally known mountain climber, was killed July 27 in a 300-foot fall from a cliff near the summit of Mt. Siyeh, one of the highest peaks in Glacier National Park, Montana.

Dr. Wynn was born near Brookville, Indiana, in 1860. He graduated from DePauw University in 1883, and was granted the degree of Master of Arts by that school in 1886. In 1885 he graduated in medicine from the Miami Medical College of Ohio, following which he served one year as intern in the Good Samaritan Hospital. After five years in general, special and insane hospital practice, he spent the years 1892 and 1893 in Vienna and Berlin, giving emphasis to work in internal medicine, diagnosis, and pathology. Locating at Indianapolis in the fall of 1893, he was selected as the first city sanitarian of that city. At about the same time he became identified with the Department of Pathology of the Medical College of Indiana. In 1896 he organized and conducted the pathologic exhibit of the Indiana State Medical Association, and this feature of the Association's work grew to such size and excellence that in 1899 the Association appropriated money and directed Dr. Wynn to take the Indiana exhibit to that year's session of the American Medical Association. This venture was so well received by the national organization that it resulted the succeeding year in the founding of the scientific exhibit which is now recognized as a prominent and important feature of the American Medical

DR. FRANK B. WYNN

Association work, and for many years Dr. Wynn served as director of this American Medical Association exhibit. He was vice-president of the American Medical Association for 1921; served his State Association as president in 1914-15; was president of the Mississippi Valley Medical Association in 1920; and since 1895 has held the chair of professor of medicine in the Indiana University School of Medicine.

Aside from his activities in medical societies and medical school, Dr. Wynn has done considerable writing, notably among which is the series of articles on "The Physician" which have run the past two years in this JOURNAL, and which are now in the course of being published in book form. Dr. Wynn's character and high ideals are splendidly portrayed in this series of articles which deal with the physician himself and his relation to the profession and his fellow men, but especially noteworthy is the article in the December, 1921, issue, "The Rejuvenation of Medical Ethics", in which he gives "The Ten Commandments of Medical Ethics". These Ten Commandments later were beautifully and artistically engraved for framing purposes.

Dr. Wynn was a great lover of nature, and was a member of the Indiana Nature Study Club, president of the American Alpine Club, and president of the Indiana Historical Society. In 1911 he was appointed chairman of the Indiana centennial commission, in which capacity he served until after the centennial celebration in 1916. Recently he was active in putting under way the Lincoln Memorial Association. During the world war he served as a captain in the Medical Corps.

The medical profession and the public in general have suffered an inestimable loss in the death of so beloved a man, but his life and influence will be remembered for years to come.

NEWS NOTES AND PERSONALS

Anything in the line of physicians' supplies or equipment may be obtained from advertisers in THE JOURNAL OF THE INDIANA STATE MEDICAL ASSOCIATION. Patronize these advertisers, for it means a continuance of their advertising patronage, and the latter means a larger and better Journal for you.

The Jasper-Newton Medical Society held a meeting at Goodland, June 30.

THE Vanderburgh County Medical Society held a meeting at Evansville, June 27.

DR. J. E. HALL, of Alexandria, is advertising his home, office and practice for sale.

THE Howard County Medical Society held its annual picnic at Cassville, June 29.

THE Jay County Medical Society held its regular meeting at Portland, July 20.

THE Huntington County Medical Society held its regular meeting at Huntington July 11.

DR. J. A. FREEZEE, of Bunker Hill, has returned from a vacation trip on Lake St. Clair.

THE Wabash County Medical Society held its regular monthly meeting July 20 at Somerset.

DR. F. E. BROAD, of Kentland, and Miss Gladys Smith, of Morocco, were married July 6.

DR. WILLIAM F. CLEVENGER and Miss Louise M. Weaver, both of Indianapolis, were married July 5.

DR. PARVIN M. DAVIS has gone into partnership with his father, Dr. D. F. Davis, at New Albany.

DR. G. E. MOATS, of Antwerp, Ohio, has moved to Fort Wayne, where he will practice medicine.

DR. JOHN J. CONNELLY, of Rockville, and Miss Harriet Hubbard, of Indianapolis, were married June 27.

DR. E. S. JONES has moved from Crawfordsville to Warsaw, where he has taken up the practice of medicine.

DR. JOSEPH HAUK, of Terre Haute, and Miss Jessie Leasure, of Oakland, California, were married June 26.

DR. I. S. MILLSTONE has removed from Gary, Indiana, to Cleveland, Ohio, where he will take up the practice of medicine.

DR. EDWARD A. SPITZKA has been appointed District Medical Officer, Second District, United States Veterans' Bureau.

DR. G. W. MACKENZIE was elected president of the Philadelphia Laryngological Society at the annual meeting on June 6th.

THE Association of Monon Surgeons held their annual convention at Michigan City, Indiana, for a week beginning July 24.

DR. GEORGE F. BEASLEY, of Lafayette, was seriously injured recently when he fell from a stepladder, falling on his head and shoulders.

DR. F. C. GUTHRIE, of Pendleton, has been appointed physician at the new Indiana reformatory during the construction period.

A $425,000 bond issue for the erection of an administration building and nurses' home at the City Hospital, Indianapolis, has been authorized.

DR. HARRY GARTON has accepted a position on the staff of doctors at the Indiana State Home for Feeble Minded Youths at Fort Wayne.

THE members of the Fountain-Warren County Medical Society and the Ben Hur Dental Association held a picnic at Covington July 12.

DR. ELWIN CLARK, of Clarksburg, and Miss Lois Thorne, of Greensburg, were married June 18 at Indianapolis. They will reside in Clarksburg.

DR. FRANK W. KERN has moved from Waymansville to Cincinnati, Ohio, where he has accepted a position with the United States Public Health Service.

DR. C. H. LAVENDER, Assistant Surgeon-General, has announced that there are twelve hundred lepers at large in twenty-five states at the present time.

DR. F. A. CHENOWETH, of Winchester, has been appointed United States examining surgeon for Randolph County, to succeed the late Dr. C. E. Milligan.

THE Kosciusko County Medical Society held a meeting on June 29 at Warsaw. Dr. A. C. McDonald presented a paper on "Acute Troubles in the Abdomen."

A contract has been let for the building of two additional wings to the Irene Byron Hospital, Fort Wayne. This will give space for twelve additional rooms.

THE Grant County Medical Society held a meeting at Marion June 27. A lecture-slide demonstration was presented by Dr. Channing W. Barrett, of Chicago.

DR. J. F. WEIR, of Evansville, has been ordered to Fort Bayard, New Mexico, where he will assume charge of the government tuberculosis sanitarium at that place.

DR. WALTER MCBETH, of Royal Center, and Miss Julia Faye Frye, of near Burnettsville, were married June 28. Dr. McBeth is practicing medicine at Royal Center.

DR. H. MONTFORD COX, of Brookston, and Miss Victorine Firsich, of Indianapolis, were married recently at Indianapolis and have taken up their residence at Brookston.

THIRTY-THREE American physicians have gone to Vienna under the leadership of Dr. George W. Mackenzie, to attend special courses given in ear, nose and throat diseases.

DR. RALPH S. CHAPPELL, of Indianapolis, is spending the summer months with Dr. G. W. Mackenzie, in the ear, nose and throat clinics of Vienna and other medical centers of Europe.

DR. FRANCIS CARTER WOOD, director of the Institute of Cancer Research, Columbia University, has announced the incorporation of the American Society for the Control of Cancer.

DR. CHARLES E. DE M. SAJOUS, of Philadelphia, has been awarded the 1922 American Medicine Gold Medal for his noteworthy contributions to the study of the glands of internal secretion.

DR. WILLIAM H. SPIETH, of Indianapolis, and Miss Viva Pearl Wilson, of Roachdale, Indiana, were married Sunday, June 25. They have taken up their residence at Lebanon, Indiana.

DR. FREDERICK C. WARNSHUIS, of Grand Rapids, Michigan, received the honorary degree of Doctor of Science from Hope College, Holland, Michigan, at its fifty-seventh annual commencement.

DR. G. E. GILLILAND has removed from Terre Haute to St. Louis, Missouri, where he will practice internal medicine. Dr. Gilliland expects to be affiliated with the Washington University Medical School.

DR. CHARLES J. HATFIELD announced his resignation as managing director of the National Tuberculosis Association at the annual meeting of the Association to take effect on October 1, 1922. He will be succeeded by Dr. L. R. Williams.

DR. F. E. WILLIAMS, of Indianapolis, has been appointed medical director of the National Committee for Mental Hygiene, with headquarters in New York City. Dr. Williams has been a member of the staff of the committee since January, 1917.

A new soldiers' hospital is to be built near the Great Lakes Naval Training Station, near Chicago, at a cost of three million dollars. A new hospital for veterans is also to be built at Camp Lewis, Tacoma, Washington, at a cost of one and one-half million dollars.

A joint meeting of the members of the Jennings, Jackson and Bartholomew medical societies was held June 27 at Columbus. Dr. Osterman, of Seymour, presented a paper on "Children's Diseases," and Dr. J. K. Hawes, of Columbus, presented a paper on "Feeding of Babies."

DR. J. MORTON HOWELL, of Dayton, Ohio, has been nominated by President Harding to be the first American minister to Egypt. Dr. Howell has been a practicing physician at Dayton for many years and for the past ten months has been diplomatic agent and consul general for this government in Egypt.

AT the fifty-seventh annual meeting of the Michigan State Medical Society, at Flint, June 7th to 9th, Dr. William T. Dodge was elected president; Dr. J. G. R. Manwaring, Dr. William E. McNamara, Dr. T. F. Heavenrich and Dr. W. K. West, vice-presidents; Dr. Frederick C. Warnshuis, secretary.

DURING July the following articles have been accepted by the Council on Pharmacy and Chemistry for inclusion in New and Nonofficial Remedies: The Abbott Laboratories: Neocinchopen-Abbott Tablets, 5 grains. Louis Hoos: Hoos Albumin Milk. Mallinckrodt Chemical Works: Benzyl Benzoate-M.C.W.

THE annual outing of the Second District Medical Society was held on Eagle Island, in the Wabash River, July 14. Papers were presented by Drs. A. A. Rang, of Washington; F. H. Austin, of Bloomington; Homer Woolery, of Bloomington; G. C. Porter, of Linton; James N. McCoy, of Vincennes; G. D. Scott, of Sullivan; and J. W. Smadel, of Vincennes.

AN institute of public health has been established at Columbia University through the bequest of the late Joseph R. DeLamar. The work of the new institute of public health will be chiefly research and the training of research workers. Dr. Haven Emerson will fill the new office of professor of public health and administration.

THE United States Civil Service Commission announces an open competitive examination for Junior Medical Officer, Indiana Service and Coast and Geodetic Survey. Applications will be rated as received until further notice. Applicants should at once apply for Form 1312, stating the title of the examination desired, to the Civil Service Commission, Washington, D. C.

IN a recent review of the activities of the Rockefeller Foundation, President G. E. Vincent states that one hundred fifty-seven individuals held fellowships during 1921, funds for which were directly or indirectly supplied by the Rockefeller Foundation. The distribution of these fellows include: Seventy-one Americans, one Belgian, seven Brazilians, eleven Canadians, one Singhalese, seventeen Chinese, one Colombian, two Costa Ricans, nineteen Czechs, seven British, four French, one Guatemalan, one Mexican, two Nicaraguans, seven Poles, two Salvadoreans, two Syrians and one Norwegian.

THE faculty in the Harvard Medical School has made many changes. L. T. Troland, formerly instructor in psychology, has been promoted to the post of assistant professor. Dr. Reginald Fitz, formerly professor of medicine at the University of Minnesota, has been named associate professor of medicine at Harvard. Other appointments are: Dr. E. P. Richardson, assistant professor of surgery; Dr. J. Bronfenbrenner, assistant professor of bacteriology; Dr. Alice Hamilton, assistant professor of industrial medicine; Dr. G. C. Shattuck, assistant professor of tropical medicine; Dr. David Cheever, assistant professor of surgery; Dr. L. D. Felton, assistant professor of preventive medicine and hygiene; Dr. J. L. Gamble, assistant professor of pediatrics; Dr. J. S. Stone and Dr. John Homans, instructors in surgery; and Drs. William H. Smith and Frank H. Hunt, instructors in medicine.

INDIANA STATE MEDICAL ASSOCIATION

The Program Committee has announced the following list of scientific papers for the annual session of the Indiana State Medical Association, to be held at Muncie, September 27, 28 and 29, 1922:

GENERAL MEETINGS

Thursday a. m.

Address of President: "The Status of the Profession in Indiana," Dr. William R. Davidson, Evansville.

Symposium: "Endocrinology"

1. Medical Phase—G. W. McCaskey, Fort Wayne.
   Discussants: Edgar F. Kiser, Indianapolis; L. P. Drayer, Fort Wayne.
2. Neurological Phase—C. C. Bitler, Newcastle.
   Discussants: Albert E. Sterne, Indianapolis; Charles P. Emerson, Indianapolis.
3. Surgical Phase—C. M. Mix, Muncie.
   Discussants: Tom Jones, Anderson; H. H. Martin, LaPorte.

Friday p. m.

Symposium: "Meningitis"

1. Differential Diagnosis—Charles F. Neu, Indianapolis.
2. Treatment—Miles F. Porter, Jr., Fort Wayne.
3. Otitic Meningitis—Harry Boyd-Snee, South Bend.

   Discussants: Robert M. Moore, Indianapolis. Earl O. Daniels, Marion. George V. Cring, Portland. D. O. Kearby, Indianapolis.

SECTION ON MEDICINE

Thursday P. M.

DISTURBANCE OF CARBOHYDRATE METABOLISM.....John H. Warvel, Indianapolis
Discussants: B. M. Edlavitch, Fort Wayne. C. R. Strickland, Indianapolis.

CONGENITAL PYLORIC STENOSIS.....O. G. Pfaff, Indianapolis
Discussants: James C. Carter, Indianapolis. W. D. Gatch, Indianapolis.

THE TREATMENT OF PULMONARY TUBERCULOSIS.....Alfred Henry, Indianapolis
Discussants: Gardner C. Johnson, Evansville. Charles R. Bird, Greensburg.

THE THERAPY OF SYPHILIS.....J. E. Luzzader, Bloomington
Discussants: C. L. Bock, Muncie. Frank G. McCarthy, Terre Haute.

Friday A. M.

SENSITIVITY TO EPIDERMAL AND POLLEN PROTEINS.....James Wynn, Indianapolis
Discussants: C. G. Beall, Fort Wayne. William D. Asbury, Terre Haute.

EPIDEMIC JAUNDICE.....S. C. Waters, Middletown
Discussants: W. M. Stout, Newcastle. Will P. Shimer, Indianapolis.

MEDICAL ADDRESS.....Charles Louis Mix, Chicago

SEQUELLAE OF LETHARGIC ENCEPHALITIS.....W. A. Fankboner, Marion
Discussants: Wier Miley, Anderson. C. A. Sellers, Hartford City.

SECTION ON SURGERY

Thursday P. M.

SURGICAL ADDRESS..Charles H. Frazier, Philadelphia

DRAINAGE OF INTRA-ABDOMINAL ABSCESSES.....J. Rilus Eastman, Indianapolis
Discussants: Miles F. Porter, Sr., Fort Wayne. Wm. J. Moore, Muncie.

THYROID DISEASE.....A. P. Roope, Columbus
Discussants: J. Y. Welborn, Evansville. F. H. Jett, Terre Haute.

GASTRIC ULCER...Frank W. Foxworthy, Indianapolis
Discussants: W. H. Foreman, Indianapolis. H. O. Bruggeman, Fort Wayne.

THE TECHNIC OF PERINEAL REPAIR WHEN ASSOCIATED WITH RECTOCELE, CYSTOCELE AND UTERINE PROLAPSE.....F. C. Walker, Indianapolis
Discussants: A. A. Rang, Washington. J. H. Weinstein, Terre Haute.

TUBERCULOSIS OF THE FEMALE GENERATIVE ORGANS.....E. E. Padgett, Indianapolis
Discussants: Carl Habich, Indianapolis. G. B. Jackson, Indianapolis.

Friday A. M.

HAMILTON COUNTY

The Hamilton County Medical Society had an outing on Sunday, July 9, at Horseshoe Lodge, fifty doctors and their families being present. A chicken dinner was served at 5:30. The afternoon and evening were so thoroughly enjoyed, and proved such a success, that a similar meeting for next year was agreed upon.

W. F. BAKER, Secretary-Treasurer.

CORRESPONDENCE

STOLEN OR LOST NARCOTIC ORDER FORMS

Treasury Department, Internal Revenue Service,
Office of the Collector, Indianapolis, Indiana.
To All Persons Registered Under the Harrison Narcotic Law:

The following ruling is for your information and guidance.

Effective immediately, Article 111½ is hereby added to Regulations 35, Revised November, 1919, as follows:

Article 111½. STOLEN OR LOST ORDER FORMS. Whenever any used or unused order forms are stolen from, or lost (otherwise than in course of transmission) by, any person registered under the Act, he shall immediately upon discovery of such theft or loss, report the same to the Commissioner of Internal Revenue, Washington, D. C., stating the serial number of each duplicate and original form stolen or lost: If the theft or loss includes any original orders received from other persons and the registrant is unable to state the serial numbers of such orders, the date of receipt thereof and the names and addresses of the purchasers thereunder should be stated. If the theft or loss is of or includes any entire books and the registrant is unable to state the serial numbers of the duplicate and original forms contained therein, the theft or loss shall in like manner be reported to the Collector of Internal Revenue from whom such books were purchased, instead of to the Commissioner of Internal Revenue, with a statement, in lieu of the numbers of the forms contained in such books, of the date or approximate date of purchase thereof: and the Collector immediately upon receipt of such report shall transmit the same to the office of the Commissioner with advice from his records (Form 679) of the serial numbers of the forms contained in such books.

M. BERT THURMAN,
Collector of Internal Revenue.
District of Indiana.

Approved:
D. H. Blair, Commissioner of Internal Revenue.
A. W. Mellon, Secretary of the Treasury.

TRUTH ABOUT MEDICINES

PROPAGANDA FOR REFORM

"MEDICAL" TESTIMONIALS FOR CHIROPRACTIC.—Chiropractors affect, with "patent medicine" fakers, a fine disdain for scientific medicine and the medical practitioner. How readily, however, do both seize with avidity any statement made by an individual who may be presumed to have the right to put "M. D." after his name—provided that statement seems favorable to the cause or may be so twisted as to make the public believe that a reputable physician has spoken a good word either for chiropractic or nostrum industry.

For some time there has been going the rounds a chiropractic advertisement purporting to quote "Opinions of Well Known Medical Men" on chiropractic. The material obviously emanates from one of the chiropractic "ad" factories. These make a business of supplying the individual chiropractor with advertising copy that he, because of educational deficiencies, would be unable to write for himself. According to these stock advertisements: ". . . there is an ever increasing number of M. D.'s all over the United States and Canada who understand, appreciate and practice straight chiropractic to the exclusion of medicine and every other method, as witness the following selected at random:" Then follow what purport to be quotations from physicians. An examination of the records of the individuals who are quoted permits an appraisement of their testimonials. (*Jour A. M. A.*, July 1, 1922, p. 57.)

DIGALEN.—Digalen was introduced with the claim that it was soluble amorphous digitoxin (a substance unknown to chemists) and with the claim that it possesses all the advantages and none of the disadvantages of digitoxin, such as cumulative effect and the production of nausea (claims which have been made for many proprietary digitalis preparations, but which always prove untenable). In 1909 the Council on Pharmacy and Chemistry admitted Digalen to New and Nonofficial Remedies after the manufacturer had discontinued the palpably unwarranted claims which had been made for the preparation. The Council did not determine whether Digalen contained "soluble amorphous digitoxin," but accepted it merely as a standardized and fairly stable digitalis preparation. Subsequently, the claim that it was a stable preparation was challenged. In view of the increased extravagance of the claims for Digalen, the Council in 1915 made a re-examination of this product and directed its omission from New and Nonofficial Remedies. There is no available evidence to indicate that Digalen has any advantage over tincture of digitalis or the infusion of digitalis for oral administration or that it is equal to ouabain or strophanthin for intramuscular or intravenous injection. With a better knowledge of proper dosage—for instance by Eggleston—an increasing number of practitioners find that, except in exceptional cases, the desired action of digitalis can be obtained by the administration of the official tincture of digitalis. (*Jour. A. M. A.*, July 1, 1922, p. 61.)

DESENSITIZATION TO RHUS.—Contrary to the theory of "desensitization" to rhus poisoning by internal administration of tincture of rhus, it appears that the susceptibility to rhus may be increased by successive intoxications. (*Jour. A. M. A.*, July 15, 1922, p. 220.)

MORE MISBRANDED NOSTRUMS.—The following products have been the subject of prosecution by the federal authorities charged with the enforcement of the Food and Drugs Act:

HOOKER'S COUGH AND CROUP SYRUP (C. B. Kingsley), containing oil of anise, oil of wintergreen, alcohol, sugar, water, bloodroot and a balsam, probably tolu.

EDGAR W. STOKES, M.D., Supt.

923 Cherokee Road **Louisville, Kentucky**

MADAM LEROY'S REGULATIVE PILLS (LeRoy Chemical Co.), containing aloes and traces of pennyroyal and tansy.

NAPTHOLENE (Dr. E. E. Sonnanstine), containing gasoline, kerosene and a small quantity of resin of red pepper.

HOMOSAN (International Toilet Co.), consisting of tablets containing a trace of strychnin.

HASKIN'S COUGH MEDICINE (Haskin Medicine Co.), liquid carrying tar, chloroform, sugar and water.

MCMULLIN'S TONIC (Tilden McMullin Co.), containing alcohol, glycerin, iodids, phenol (carbolic acid) and water.

DUPREE'S FRENCH SPECIFIC PILLS (United Drug Exchange), containing aloes, iron sulphate and a trace of alkaloids, with indications of cottonroot bark and tansy.

APOLLO BRAND SEXUAL PILLS (S. Pfeiffer Mfg. Co.), containing extract of nux vomica and damiana and phosphorus.

GIEPSI VEMELA (Giepsi Vemela Co.), consisting of vegetable extractives, sugar and water.

MONTAUK STAR BRAND PILLS, containing iron sulphate, aloes and a trace of strychnin.

PRINCESS BRAND PENNYROYAL, TANSY AND COTTON ROOT BARK COMPOUND PILLS, containing aloes.

SHORES LUNG BALSAM (Shores-Mueller Co.), containing pine tar, ammonium chlorid, a salicylate, chloroform, glycerin, sugar and water.

SHORES MOUNTAIN OIL LINIMENT (Shores-Mueller Co.), containing cajeput, wintergreen, sassafras, cedar oils, camphor, ammonia, borax, washing soda, plant extractives, capsicum oleoresin, alcohol and water.

SHORES SARSAPARILLA (Shores-Mueller Co.), containing extracts of plant drugs, including a laxative, a salicylate, a small amount of ammonium chlorid, a trace of alcohol, glycerin and water. (*Jour. A. M. A.*, July 15, 1922, p. 232.)

HAELEPRON TABLETS NOT ADMITTED TO N. N. R.—Haelepron Tablets are made by Bodenstein and Galinsky, Berlin, Germany, and sold in the United States by the Haelepron Sales Co., New York. The following, nonquantitative statement of the composition of Haelepron Tablets appears on the trade package: "Haemaglobin, Lecithin, Calc. Lact., Protein vegetab., Ferr. Sacch., Ferr. pyrophos." The Council on Pharmacy and Chemistry finds Haelepron Tablets inadmissible to New and Nonofficial Remedies because, (1) their composition is indefinite and semisecret; (2) the recommendations for their indiscriminate use are unwarranted; (3) the name is not descriptive of their composition, and (4) they are an irrational and useless combination which can have little, if any, effect on the conditions for which they are recommended. (*Jour. A. M. A.*, July 22, 1922, p. 319.)

PLATT'S CHLORIDES.—An advertisement for Platt's Chlorides calls attention to the fact that chlorin antiseptics are at present in favor. The statement is then made that "chlorid of lime" is perhaps the best known of the older chlorid antiseptics. In the advertising it is stated, more or less directly, that Platt's Chlorides contain "chlorid of lime." Chlorid of lime is an unscientific name for chlorinated lime, official in the U. S. Pharmacopeia as Calx chlorinata. An analysis of Platt's Chlorides, made in the A. M. A. Chemical Laboratory several years ago, failed to show that the preparation contained any active chlorin derivatives upon which the virtues of chlorinated lime depends. Chlorides were present, but chlorides are not known to have any germicidal effect. A re-examination of Platt's Chlorides, made recently in the Association's Chemical Laboratory, again demonstrated the absence of active chlorin such as contained in chlorinated lime. (*Jour. A. M. A.*, July 22, 1922, p. 319.)

NEW AND NONOFFICIAL REMEDIES

ANTI-ANTHRAX SERUM—P. D. and Co.—An anti-anthrax serum (see New and Nonofficial Remedies, 1922, p. 284), marketed in syringes containing 50 Cc. Parke, Davis and Co., Detroit.

ANTIMENINGOCOCCIC SERUM—P. D. and Co.—An antimeningococcus serum (see New and Nonofficial Remedies, 1922, p. 286), marketed in packages of two syringes, each containing 15 Cc.; also in packages of one syringe containing 50 Cc. Parke, Davis and Co., Detroit.

DIPHTHERIA TOXIN-ANTITOXIN MIXTURE—P. D. and Co.—A diphtheria antitoxin-toxin mixture (see New and Nonofficial Remedies, 1922, p. 282.) Each cubic centimeter represents a single human dose. It is marketed in packages of three bulbs representing one immunizing treatment; also in vials containing 20 Cc. Parke, Davis and Co., Detroit.

TUBERCULIN B. F. (Bovine)—P. D. and Co.—A preparation of tuberculin Denys (see New and Nonofficial Remedies, 1922, p. 296). It is made in the same manner as tuberculin Denys (Human), except that the bovine type of tubercle bacillus is used. It is marketed in packages of six 1 cubic centimeter sealed glass tubes. Parke, Davis and Co., Detroit.

BORCHERDT'S MALT COD LIVER OIL AND PHOSPHORUS.—Each 100 Cc. contains phosphorus, 0.009 Gm.; cod liver oil, 25 Cc., and Malt Extract (Plain), (see New and Nonofficial Remedies, 1922, p. 176), 75 Cc. Borcherdt Malt Extract Co., Chicago. (*Jour. A. M. A.*, July 8, 1922, p. 135.)

YEAST PREPARATIONS.—The Council on Pharmacy and Chemistry has adopted a general discussion of yeast preparations for inclusion in New and Nonofficial Remedies. In this article it is stated:

> The use of yeast as a bactericide in external infections has been practically abandoned. Yeast and preparations derived therefrom have been widely extolled of late as sources of vitamine B whenever there may be indications for its therapeutic use. However, these indications are so indefinite and the opportunities of obtaining vitamin B through the customary foods are so abundant that the demand for yeast vitamin seems to be limited. The therapeutic aspects of the vitamin problem are still in the experimental stage. Yeast has a laxative action, but the cause of this action is not known. Yeast has been recommended for internal administration because of its supposed beneficial effects upon furuncles, acne, etc. Many clinicians doubt this effect, which may, after all, be expected from any anticonstipation agent. It is not clear to what extent, if at all, live cultures of yeast may be used to change the intestinal flora in cases where such a change is desirable. (*Jour. A. M. A.*, July 8, 1922, p. 135.)

EPINEPHRINE—G. W. C. Co.—A brand of epinephrine—N. N. R. It is marketed in vials containing epinephrine—G. W. C. Co. (base), 1 grain, and in the form of Epinephrine Chloride Solution—G. W. C. Co., which contains epinephrine hydrochloride equivalent to 1 part of epinephrine in 1,000 parts of physiological solution of sodium chloride. G. W. Carnrick Co., New York.

PITUITARY EXTRACT-LEDERLE (*Obstetrical*).—An extract of the posterior lobe of the pituitary body of cattle, approximately two and one-half times the strength of solution of hypophysis, U. S. P., preserved by the addition of chlorbutanol. For actions and uses, see New and Nonofficial Remedies, 1922, p. 213, under Pituitary Gland. Pituitary Extract-Lederle (Obstetrical) is marketed in 0.5 cubic centimeter and 1 cubic centimeter ampules. Lederle Antitoxin Laboratories, New York.

PITUITARY EXTRACT-LEDERLE (*Surgical*).—An extract of the posterior lobe of the pituitary body of

THE CORRECTION OF CLUB FEET*

H. R. ALLEN, M.D.
INDIANAPOLIS

"The Treatment of Club Feet" was the title assigned for my paper. I think these feet have been treated entirely too much, so I have substituted the word "Correction" in place of "Treatment" as it is more appropriate to the method I shall describe. In the least number of words I desire to present a few facts concerning this system of transforming club feet into perfectly normal feet.

There is nothing mysterious about this standardized deformity nor about any one of the four distinct foot deformities that compose it. In over twenty-five years this system has not failed and out of the hundreds of doctors who have referred patients to me for this system of treatment, there is not one who can point to a single case that ever had to return for reoperation. The cases treated range in age from six hours to over sixty years old. I do not believe in "recurrent club feet" nor in recurrent surgery. I do not believe in substituting one permanent deformity for another.

I do believe that any case of this deformity can be absolutely corrected in form and function, with normal range of motion. The treatment must be completed in less than one year, no matter how old the patient is. In younger cases the time limit, of course, is greatly reduced, and the process is simplified. Furthermore, several of the complications[1] frequently associated with this standardized deformity are automatically and simultaneously corrected.

In the correction of standardized club feet there is absolutely no excuse for cutting or breaking or even touching a bone. However, it is very essential to rearrange their abnormal, deformed positions. This can be done by releasing the grip of the short, soft, deformed tissues that hold the bones in a false position. I have stated only a few of many important and commendable facts pertaining to this system, which is as painless as any other system could be and its results gain favor by comparison with any system of treatment.

The development of this system began long ago. It is founded upon the principle of combining the best methods of permanently correcting each one of the four individual and distinct foot deformities into one straightforward, logical and surgical procedure. In order to perfect this system it was found necessary to construct certain precision tools, and also to design dependable devices that would maintain with accuracy each degree of overcorrection during post-operative treatment.

The best and most skillful operation may become a partial or complete loss if the benefits gained surgically cannot be maintained mechanically.

The standardized club foot, shown in Fig. 1, is a compound deformity composed of adduction, cavus, varus and equinus. Associated deformities, regardless of their frequency or infrequency, are merely complications, since they do not occur constantly in all club feet. In

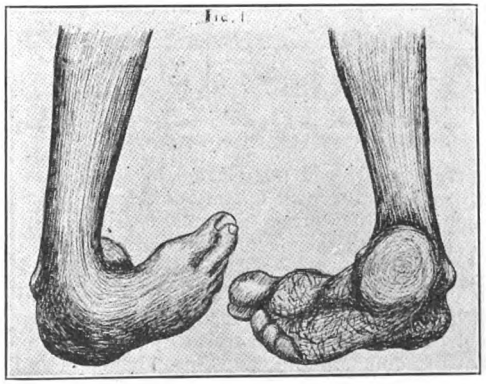

Fig. 1. Dorsal and plantar view of standardized club foot showing proximity of heel and toe due to the combination of adductus and cavus. Think how remote they are in a flat, valgus foot. Walking is done on the top of the foot instead of on the much wrinkled, unused sole. The heel is higher than the malleoli. The toes are hooked up by adduction. Evidently equinus refers to the tarsus primarily and to the anterior foot secondarily.

*Read before the General Meeting of the Indiana State Medical Association. Indianapolis Session, September, 1921.

(1) In a previous article, "Facts Concerning Club Feet," this deformity is standardized and several of the frequently associated deformities are referred to as complications, so further mention of them here is unessential as we are discussing merely the correction of "Standardized Club Feet."

working out this system of treatment, the permanent correction of adduction was first developed, then each of the succeeding separate and distinct foot deformities was taken up in the order mentioned above. As development progressed it was found possible and practical to convert the deformities of adduction and cavus simultaneously into abduction and planus by using one reduction tool. The deformities of varus and equinus are individually converted into valgus and calcis positions by one other precision tool, but the position of the tool must be turned 90 degrees. The four component deformities are converted into their opposite deformities by using two reduction tools.

The next item of great importance was to develop a single retention tool that would hold with exact precision every desired degree of overcorrection until the foot was sound and well. With these precision tools and with strict attention to the details of this system, any surgeon skilled in mechanical affairs ought to secure perfect results every time. The whole topic of treating club feet involves good or bad

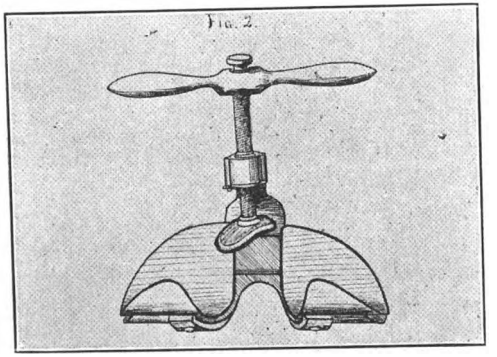

Fig. 2. The adducto cavus corrector is adjustable for all sizes of feet whether rights or lefts. When its double sliding tracks are lubricated, friction becomes practically negligible. After designing a variety of these instruments with roller and ball bearings and pivoted rather than track movements experience has recommended this type.

mechanics. If patients, treated by any system, return for subsequent operations there is something radically wrong with the system, with the tools, with the operator, or with all three.

The tools used in the correction I am now to describe are named according to the duty each performs. For example, the adducto-cavus tool (Fig. 2) is used to transform the deformities of adduction and cavus into abduction and planus. The foot is placed in the tool as shown in Fig. 3. Then the screw pressure is applied at an angle of 45 degrees, which approximately represents the resultant of resistance offered by the combination of adduction in a horizontal plane and cavus in a vertical plane of flexion. When the pressure is applied for ten seconds, and never longer, the heel and toe instantly move away from each other.

In order to avoid unnecessary pressure under the tarsal pad (Fig. 3 A) a double sliding track for heel and toe plates (Fig. 3 A & B) are provided to reduce friction. This tool never crushes bones. It merely lengthens the short, deformed, soft tissues as they present themselves in offering resistance to correction. Previous to using this tool, however, the flexor brevis digitorum and other gross tissues remote from bones are divided by the tenotome through a skin puncture ⅛ of an inch long.

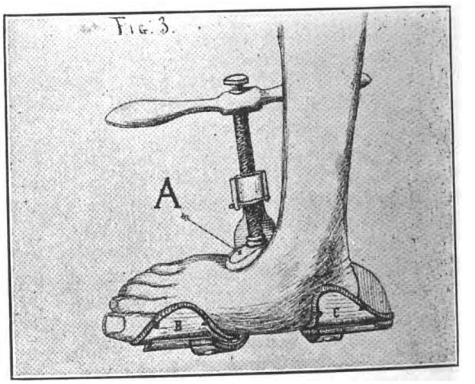

Fig. 3. The foot is shown converted into a position of abducto-planus. The pressure of pad "A" has produced a separation of "B" from "C". Note that the pads on "B" and "C" are sewed fast to the sliding platforms.

The remaining two deformities are corrected separately by the varo-equinus instrument shown in Fig. 4 A. In correcting the varus deformity the long axis of the foot is placed at right angles to the long lever as shown in Fig. 4 B. In using this instrument for any purpose the strap must always be used below

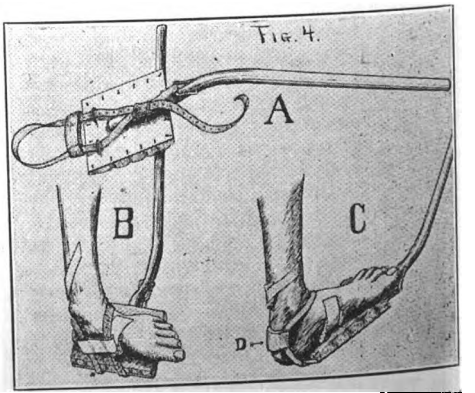

Fig. 4. The long lever arm is bent up for the sim... a wagon pulled by its tongue will go straighter than it ... from behind. As a general rule it is better to lead ... This tool with its pad securely sewed in place gives ... of position between foot and leg provided the strap is ... malleoli. It is therefore useful in breaking up adhesions ... dislocated ankles and correcting rigid flat feet and the ... equally on right or left feet of almost any size.

the anke bones. The lever arm is so long[2] that the power to be employed is minutely and safely gradated. The little finger is strong enough to convert any varus deformity into an extreme valgus position.

The varo-equinus instrument is now turned 90 degrees so that the long lever lies parallel with the long axis of the foot as shown in Fig. 4 C. The transverse heel pad (D) is placed across the heel and the lever is brought up on a trial trip to see that all anterior foot flexion has been overcome (Fig. 4 C). Then the Achilles[3] tendon is cut in the usual oblique manner and then the lever is brought up until the equinus deformity is transposed into an extreme position of calcis.

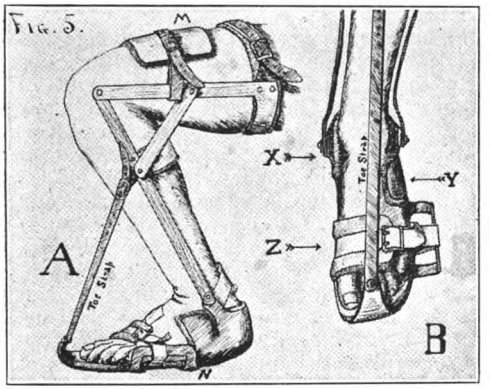

Fig. 5. The knee joint is locked with foot and femur parallel, producing a popliteal angle less than a right angle. Pads "M & N" represent an orthopedic vice for the thigh, leg and foot although the ankle joint may move. One look is sufficient evidence that the foot cannot turn in while the brace is on. Furthermore any normal degree of eversion is self evidently a simple matter of twisting the lower ends of the leg bars outward, or you may set the ankle joint rivet farther back on the outside than on the inside. To remove the brace only four straps are to be unbuckled. The straight edge out rigger on the little toe side projects far enough to control any degree of abduction.

The surgical correction is now completed provided the little finger can easily lead the foot into the extreme limits of normal range of motion in each of the opposite deformities, because success or failure abide in the zone of the tarsus.

Assuming that the surgical correction is now complete, we should study most carefully and critically both the construction and the rules for wearing the adult retention brace shown in Fig. 5 A. This brace, a simple device, devoid of all superfluous parts, fulfilling its exact purposes, is designed on the ancient plan of keeping the foot and femur parallel[4] and at the same time holding the leg and thigh so that they make an angle, less than a right angle, with its apex in the popliteal zone. No man can hope for perfect and uniform results by using any other known position. This one brace gives absolute and precise control over each position gained during the surgical correction and maintains that gain until the foot is permanently cured. The padded foot plate (Fig. 5 A & B) is provided with vertical plates for the inside of the heel and for the outside of the tarsus. The inelastic webbing strap pulling across the pad on the anterior part of the foot acts like the power arm of a lever and controls any desired amount of abduction by its outward fixation. The arrows (X, Y & Z) in Fig. 5 B indicate the direction of lever energy. The control over the corrected cavus and equinus is regulated by the toe strap. The desired amount of overcorrected varus is maintained by having the padded foot plate hinged higher on the external than on the internal side. The pad that rests on top of the thigh, indicated by the letter M, prevents the knee from rising when the toe strap is tightened. Pads M and N represent a fixation vice for securing the foot, leg and thigh. The bars along the thigh and leg making in-toeing impossible, and assure any normal amount of out-toeing by merely twisting the lower parts of the leg bars outward.

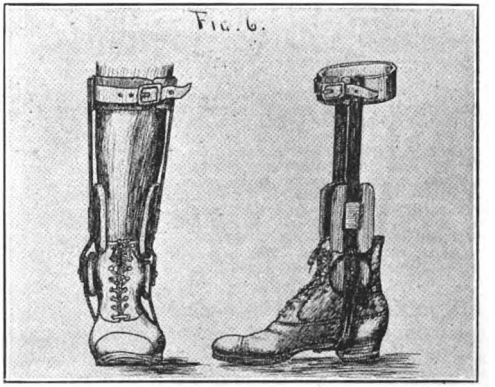

Fig. 6. Front and side view of left walking brace with sole and heel thicker on external side. This is a two bar brace with both internal and external ankle and low leg pads. Ordinarily either type of pad is sufficient, provided a firm bearing against the external side is secured. In order to make a one bar brace you cut off the vertical, internal stirrup close to the sole and detach the leg bar from the internal end of the leg band. Then slip the leg band around 90 degrees and secure it to the top of the external leg bar. Patients who have walked all their lives on the tops of their feet appreciate the sense of security afforded by the double barred brace with firm bearing pads on both sides of their ankles when they walk for the first time in their lives on the soles of their feet.

(2) Short levers are considered very dangerous because tissues not intended to be elongated may be instantly and unintentionally torn and damaged after the resisting tissues let go under the strained muscles of the operator.

(3) In adult cases the flexor brevis and the Achilles tendon are cut. Sometimes the anterior tibial is cut but I have never found it necessary to do any other cutting. If each puncture area is sterilized, and covered with gauze held in place by a strip of spirally applied adhesive plaster, one end of it can be pulled up when the tenetome is used and instantly put back. This prevents contamination during manipulation. It saves time and frequently the loss of one drop of blood, aside from betraying that commendable quality of forethought.

(4) More than 50 years ago, my father was the first surgeon to use a brace that held the foot and femur parallel while correcting a club foot. More than 25 years ago I demonstrated the advantages of the acute popliteal angle.

Except for removing the brace once or twice a day for massage or bath or inspection under bearing areas, this brace is worn constantly until the foot shows no tendency to return to any one of its original foot deformities, after being entirely free from all restraint for several hours. It is then worn only at night and the walking brace is worn during the day.

Front and side views of the walking brace are shown in Fig. 6. It may be made of one, or preferably two, vertical bars hinged at the ankle to the stirrup that is riveted to the sole of the shoe just in front of the heel. The sole and heel are thicker externally than internally. This brace should be worn for several months to encourage a normal range of valgus motion and to provide ample time for cartilaginous and osseous development where needed in the tarsal zone.

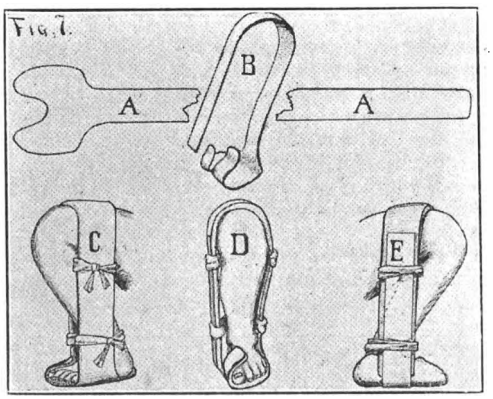

Fig. 7. "AA" represents the galvanized pattern for the infant retention brace before being bent into proper shape. "B" represents it bent into shape before being padded inside and out with woolen blanket cloth. The location of the bend over knee determines the length. Gauze bandages behind the popliteal space hold the knee forward, while one behind the heel prevents posterior displacement. A piece of adhesive plaster runs all the way around the brace and secures the size of the brace after it has been determined. Any degree of correction is easily established by bending the brace where bending is indicated. In this brace as in the adult brace the foot and femur parallel design takes care of any degree of in toeing or out toeing. Notice too that the bandages are not constrictors. They do not surround the leg. They merely go behind it and behind the heel.

Fig. 7 shows the infant retention brace. This is the simplest and most fool-proof of all surgical appliances that lay any claim to absolute efficiency. It is sanitary and it is easy to remove and to replace. It is adjustable for size and growth, and for absolute control over each item of overcorrection. It is made of a single piece of flexible, galvanized, non-rusting steel as shown in Fig. 7 A A & B. It is padded and worn in comfort. Also it is built on the foot and femur parallel plan with an acute popliteal angle. Since infants do not walk there is no need for discussing their walking braces. They seldom require any operation other than manipulation, but if the tarsus does not yield completely by manipulation then see to it that it yields by the other methods and stand firm for the permanent and perfect correction of every detail.

DISCUSSION

DR. G. D. MARSHALL (Kokomo): Dr. Allen's paper of course deals with the mechanical treatment of club feet, and I am perfectly in accord with that opinion. I think that is the method of choice in dealing with this condition In the pathological anatomy of club feet we have certain things to deal with. One of them is the fact that the deltoid ligament holds the foot in the position of varus. It has been found by dissection that if all the other ligaments were removed and the deltoid remained, the deformity would persist. Reasoning from that standpoint there have been various operations advised.

In the treatment of this condition age has considerable to do with the result, and indicates the method of treatment. I am not quite so sanguine as Dr. Allen about the age of these patients. If you are going to reform a foot, treatment must be early, but operation cannot be done before the child is two years old, as before that age the bones are not sufficiently formed to permit of the dissection of the periosteum from the bone, with insertion of ligaments.

The doctor is to be congratulated on the non-recurrence of club feet. Almost all men admit that they do have recurrence of the clubbing. That is probably because it has not been properly corrected in the first place, or the treatment has not been pursued for a long enough time. I think the time element has a great deal to do with it. I do not think you can accomplish rapid cure of club feet, because it takes a certain amount of time for the bones to mold to the proper shape and position.

In making an x-ray of club feet, or any other x-ray on a child of that age, you see only the centers of ossification of the bones. You have very little bony structure to deal with, and it seems to me that it is entirely futile to do a bone operation at that time. I think if these cases are gotten at once and given the proper attention for correction, and properly retained, you get a very good result. I think the best functioning feet I have seen were the result of being held in position by adhesive strapping and mechanical apparatus.

DR. OSCAR T. SCAMAHORN (Pittsboro): I have a son who was born with club feet. He was born about one o'clock in the morning, and about ten o'clock that same morning I had him up to Dr. Allen and he put him in a brace. He took a piece of silver wire and molded it after the fashion of this large brace, and with adhesive strapped the foot into the position he wanted. About every two weeks this boy had his brace changed. He wore this brace about five months, and he began to walk at thirteen months. He is as active as any boy.

DR. H. R. ALLEN (closing): One point I want you to bear in mind is that I never touch the bones in correcting a club foot regardless of age or other conditions. You do not have to touch the bone to correct club feet. If you want your patient to be comfortable after the operation, overdo the correction while you are operating. What you gain during the operation you will maintain mechanically afterwards, but what is not gained and not maintained the patient will not get during his lifetime. So do your work thoroughly, put the foot in the position in which it belongs, and hold it there with the retention brace.

SEPTIC INFECTION FOLLOWING ABORTION OR DELIVERY*

A. S. JAEGER, M.D., F.A.C.S.
INDIANAPOLIS

These notes being in no sense a paper or treatise on the subject, I shall at once present for your criticism my method of treating septic infection following abortion or term delivery.

Successful treatment depends upon a careful study and correlation of certain diagnostic points, as follows: (1) Past history, especially as to previous pelvic disease, gonorrhea, lues, malaria, typhoid, etc. (2) Is the present infection an acute flare-up of a chronic condition, or an acute primary infection? (3) Patient's condition during pregnancy.

STATUS PRAESENS—(1) Focal infections, (2) possible causative factors, (3) time of appearance and type of symptoms, (4) pulse and temperature. Rectal temperature only is reliable. One not infrequently sees a variance of from two to four degrees between mouth and rectal readings. Special attention should be paid to the relationship between pulse rate and temperature curve. A high temperature unassociated with an appreciable increased pulse rate is not in my experience as of serious import as a rapid, bounding pulse, regardless of temperature. (5) Abdominal distention, tenderness, pain, localized or ascending peritonitis. (6) General systemic reaction. Blood pressure curve, urinalysis, etc.

LOCAL EXAMINATIONS—1. Character of vaginal discharge. An absence of, or scanty, discharge may lull us into a false sense of security. 2. Is cervical os patulous or contracted? Degree of drainage therefrom. 3. Is uterine body involuted or not? 4. Is the uterus empty or not? 5. Has the infection passed the confines of this organ and involved the pelvic lymphatics, adnexa or cellular tissues?

LABORATORY FINDINGS:—1. Blood cell count, coagulation time, etc. 2. Blood culture and smears. 3. Smears and culture of local discharges.

*Presented before Section on Surgery of the Indiana State Medical Association, Indianapolis Session, September, 1921.

Pardon me if I appear too emphatic in again reiterating that a careful correlation of the foregoing points frequently makes for the difference between successful and unsuccessful treatment. For example, undervaluation of the patient's constitutional reaction has led to the performance of certain seemingly indicated local measures which had better have been left undone.

If examination leads to the conclusion that the infection has passed the bounds of the uterus, and pelvic structures are involved, there is more or less progressing peritonitis and undoubted constitutional involvement, *i. e.*, bacteremia, septicemia or pyemia—I feel that any local major operation is of little avail. At most (?) a careful removal of free material from the uterus may be permitted, and if indicated some method used to promote free drainage, but hysterectomy or any other intra-abdominal interference is unwarranted, for the patient is now suffering from a disseminated systemic poisoning, the infection having passed far beyond the confines of its initial implantation site, and any involved operative manipulation tends to hasten rather than to retard a fatal outcome. Of course if there is free pus in the pelvis, colpotomy should be done and drainage established. However, in general, our best hope for such cases is in proper constitutional measures, as outlined further on.

LOCAL MEASURES:—If local interference is indicated, the following is my usual course, modified to meet individual indications: The patient is sent to the hospital if not already there. These cases cannot as a rule be handled satisfactorily otherwise. No other alimentary cleansing besides colon flushing is ordered. Blood, for count and culture, and specimens of genital discharges are taken for smear and culture, and urine is sent to laboratory. The following proctoclysis: Sodii salisylas gr. xxx-xl; sodii bicarb. and glucose of each ounces i-ii; normal salt sol. ounces xxiv-xxx, is at once begun and continued until patient is removed to surgery. Patient is prepared in usual way for vaginal operation. For some years I have discarded the pre-anesthetic administration of morphine and have given in its stead chloretone gr. x-xv per mouth. The anesthetic of choice, if any is given, is nitrous oxide and oxygen. The cervical canal is carefully dilated and a uterine sound introduced for purpose of demonstrating the length and relative direction of the cavity. It has been my fortune to have seen, as have doubtlessly most of you, a number of perforated uteri, due to failure of the operator to assure himself as to this before recklessly gouging, scraping or pulling on tissue. A tonsil sponge forceps, or similarly blunt instrument, is used to remove all free material. No effort is made to remove adherent masses, *nor is the uterine curette ever*

introduced. A uterine applicator forceps covered with gauze or tape, and saturated with 50 percent tr. iodine in alcohol solution, is used to gently but thoroughly swab the entire uterine cavity. If the case is of the mild type, and I feel reasonably certain that the uterus is empty, nothing further is done. The patient is given 1 cc. obstetric pituitrin or some form of ergot hypodermatically, and returned to bed. If the type is moderately severe, or there is probability of unremoved free or adherent material, the cavity is packed with gauze saturated with 50 percent tr. iodine in alcohol solution, to be removed in 24 hours. I have yet to find this fail to take care of any retained material, it usually being expelled 24 to 36 hours after removal of the packing, without any untoward symptoms in the meantime. If the condition is more severe, and there is found a fetid or purulent discharge, necrotic secundes or phlegmons, a fenestrated soft rubber tube is introduced well into the uterine cavity, and sutured to the labium. The tube should protrude sufficiently from the ostum vagina to permit attachment of irrigating tip without removal of vaginal pad, through an opening in which the tube has been carried.

POST-OPERATIVE TREATMENT:—The patient is placed in bed with the head-end sufficiently elevated to aid uterine drainage. As soon as considered safe, she is placed in the modified Fowler position. I believe this is superior to the prone position, favoring as it does free drainage, and preventing the possible reabsorption of toxic material from accumulated discharges. Proctoclysis is immediately begun as per before mentioned formula. If the bowel is intolerant, hypodermoclysis of soda and normal salt solution, or normal salt solution intravenously, is given. I think this is of inestimable therapeutic value for it replaces lost body fluid; to some extent at least, allays thirst; dilutes toxins; neutralizes acidosis; reduces or frequently abolishes post-anesthetic discomfort; and acts as a food. If the general picture of the case leads to the belief that the infection is of the streptococcus type, I do not wait for smear or culture reports, but immediately give 50 cc. polyvalent antistreptococcus serum intravenously by preference, and repeat as indicated in 12 to 18 hours. If this serum is not obtainable like quantities of normal horse serum are given. I might say that I have seen some very pleasing results, not only in cases of this type but in non-puerperal acute pelvic inflammations, especially where the gonococcus seemed to be the determining factor, follow the use of normal horse serum. Whether or not the effect of serum injection depends upon the specificity of the serum used, or upon a general cell protein-splitting ability, thus promoting anti-body formation, I do not presume to say, but my own experience seems to bear out the latter hypothesis. On occasion when serums were not obtainable, I have resorted to the intravenous injection of 30 grains of chemically pure sodium iodide in 20 to 30 cc. dilutions, repeated at appropriate intervals, with seemingly satisfactory but slower results.

In my humble opinion the very best of all intravenous procedure is blood transfusion. Two hundred to 300 cc. of the patient's blood is withdrawn, if her general condition does not too strongly contraindicate, and replaced by an average of about 700 cc. of donor's blood. I believe the withdrawal of some of the patient's toxic blood is for obvious reasons good practice.

Ice-bags are applied to the lower abdomen, or hot bags when cold is not well borne, and while either one may allay pain by reflex action, I am frank to state that it is to me an unsolved problem, whether the application of either heat or cold to the external abdominal surface exerts any specific influence upon the actual pathology of an intra-abdominal condition. I have made some experiments by applying water-bags at ordinary body temperature, sand-bags or shot-bags of like weight, and have about come to the conclusion that the good effects are the result of the bags acting as splints, and the retention of their position *in situ* enforcing body repose, rather than to an ability to cause any rapid change of volume or temperature from the superficial abdominal parietal to the deep visceral or pelvic circulation; or to any direct action upon the visceral structures involved, which in view of anatomical relationships seems doubtful.

If a retention tube has been introduced, the nurse is instructed to irrigate at 3 to 4 hourly intervals, one pint of equal parts of alcohol and sterile water (if alcohol is obtainable), or next best one to two drachms of tr. iodine to the pint of water. Hypertonic salt solution has also proven of much value. These three agents however have given me more satisfaction than any other solution tried.

Ergot in some form and appropriate dosage up to 60 minims by mouth is given three to four times daily for some days, as I feel the resultant uterine contractions aid in the expulsion of retained material or formed exudates and the closure of sinuses tends to prevent continued introduction of septic material into the circulation.

For pelvic or diffuse peritonitis, the remedy par excellence in my hands is opium, in the form of rectal suppositories, used as high as half grain doses at three to four hourly intervals; and knowing that I lay myself open to much adverse criticism I nevertheless maintain that opium for peritonitis and acute pelvic inflammation is well-nigh as specific as quinine for malaria. The argument that it does harm

by drying up secretions, etc., does not hold good, especially not when copious procto- or hypodermoclysis is used.

Other appropriate constitutional therapeusis is used according to the individual case, although I find that natural salicylate of soda in gr. xv doses from one to three hourly intervals combined with bicarbonate of soda, or the following combination: Hydrarg. chlor. corros. gr. 1/48—1/30, Fowler's sol. mm. iii, tr. ferri chlor. min. iii-v, tr. nux vomic. min. v-x, given about four times daily, meets the usual requirements.

I have not missed the internal administration of alcohol, and feel its value has been greatly overestimated. However this does not mean that I would not use it, for it has its value, though no more so than other stimulants which can be used.

Time prevents me from entering into a more detailed explanation of each step of the method I follow, feeling that the reason therefor and the result expected are self-evident. Also, it must always be remembered that individualism is the keynote of successful treatment in every case, therefore the above outline must be adapted to meet specific indications.

A differential diagnosis is occasionally as difficult as it is important, *i. e.*, I have known of cases in which needless curettage, etc., and in one instance hysterectomy was done, where further careful study of the cases showed lues, malaria, typhoid, acute tonsillitis, etc. My method of treating these infections may, as a whole or in part, meet with the decided disapproval of many of my friends whose opinion and judgment I value highly; but in view of the fact that no claim as to originality is made, I may state without fear of being misunderstood that, after following it for some fifteen years or more, it has proven most valuable to me.

In conclusion may I submit two recent cases which concisely demonstrate the above outlined method of treatment:

Case I:—Mrs. F. C., native of Spain, 36 years old, married 18 years. First seen by me in consultation with Dr. L. Witt, March 15, 1921. Past history: Negative as to the usual diseases of childhood. Gives history of having had malaria in years past. Mother of seven children. No previous troubles in confinements. Three children died at various periods after birth. Three months before the birth of her last child, which occurred March 9, 1921, she complained of soreness in the region of gall-bladder. Patient began labor at 2 or 3 a. m., March 9th. Membranes ruptured spontaneously about 6 or 7 a. m. Her physician states she had a dry labor, and was delivered without forceps about midnight of March 9th. No laceration. Placenta expressed about 20 minutes later intact. Patient seemed normal until 11 p. m. March 10th, when she had a chill, and developed a pain in the upper left side. On the morning of March 11th her temperature was 101 per mouth, pulse 90. She had a very severe pain in region of gall-bladder, in mammary line on level of ninth rib, and under right scapula. By afternoon of March 11th pain subsided, but temperature continued 101 in morning and 102 at night with pulse of 90 to 100, until the morning of March 15th, when she had another chill.

She was first seen by me about 11 a. m. of this day. Facial expression worried; skin pallid and leaky; tongue coated; breath fetid; temperature 100.2 per mouth, 104 per rectum; pulse 100 bounding; blood pressure, systolic 160, diastolic 90. Nose, throat and teeth, seemingly normal. Lungs and heart negative. Liver and gall-bladder seemingly negative. Abdomen slightly distended. Pain and tenderness negative above umbilical line, quite tender in pelvic region. Vaginal examination: Very scant, yellowish discharge, some odor. Perineal scar from previous third degree laceration. No recent tear. Cystocele and rectocele. Cervix shows evidence of old bilateral laceration. Cervical os contracted. Uterine body boggy, subinvoluted and tender. Adnexa and pelvic cellular tissue congested and tender.

Patient was removed to the Methodist Hospital, reaching there about 3 p. m., at which time her rectal temperature was 107, pulse 140. She was prepared for the surgery and operated at 5 p. m. in the usual manner. The uterine cavity measured six inches. Only a few shreds of secundes were found, but a number of masses of necrotic uterine tissue, some as large as one inch in diameter were removed. The cavity was swabbed with 50 percent tr. iodine in alcohol solution. A fenestrated rubber tube was introduced and attached by suture to the labium. The patient was returned to her bed, and the usual post-operative continuous proctoclysis, with the addition of 60 gr. salicylate of soda was at once begun. Fifty cc. anti-streptococcus serum were given intravenously, and repeated the next morning, March 16th, at 9 a. m.

The temperature curve is interesting. On March 15, 6 p. m., after return from surgery, the rectal temperature was 108, and then gradually receded until by 3 p. m. March 18, it was 99 rectal. It remained so until 6 p. m. of March 20, when without any warning her general condition having been very good, she had a chill and the temperature rose to 106 rectal. In view of the fact that she had a past history of malaria, previous medication was stopped, and quinine given, after blood had been taken for examination. This and a number of other examinations for plasmodia were unsatisfactory, although it was thought by one examiner that there were some bodies noted which might be

plasmodia. By March 21st the temperature was again normal and remained so until March 28, on which afternoon it again shot up to 102 4/5 and ran a variable course, never over this, until April 4, when it became normal and remained so.

The laboratory findings in this case were disappointing. I owe much thanks to Dr. Warvel for his painstaking efforts, but repeated blood and local discharge cultures and smears were negative. The white cell count also was interesting. When the patient entered the hospital the white cell count was only about 6,000, and at no time, in spite of the rather stormy clinical picture, was there a count above 18,000.

The post-operative treatment was as outlined in the above notes. At this writing I am informed that the patient is apparently well.

Case II.—Mrs. M. S., aged 22 years, American. Married 4 years. First seen in consultation with Dr. Geo. Bowman, June 18, 1921. Past history: Usual diseases of childhood. No after effects. Also has had diphtheria and attacks of acute tonsillitis. None recently. Catamenia began at 14 years. Always irregular but not painful. Married at age of 18 years. Mother of two living children; the youngest 16 months old, still nursing at breast. Had one miscarriage between first and second term delivery. About June 8, 1921, the nursing child, while at the breast, bit her about an inch to the left of the right nipple. The area has been painful since. History of present illness: On the morning of June 15, 1921, without any known reason she aborted, passing as was thought all the products of conception. The family think the pregnancy was about 3 months, but are not certain as she had not menstruated since birth of last child. Being inclined towards the Christian Science persuasion, no physician was called. She continued to bleed without intermission, when on June 18, 1921, about 10 a. m., she had a prolonged chill and "sinking spell". About 4 or 5 p. m. her condition became such that Dr. Geo. Bowman was called. He saw her at about 5:30 p. m. At this time there seemed to be no active bleeding from the vagina, and as he does not handle obstetric cases, he simply applied restoratives, made no digital examination, and invited me to see the case.

I saw the case with Dr. Bowman about 7 p. m. June 18, 1921. Status præsens: The patient is a well nourished young woman. Her face is pallid; lips lemon color; pulse 120, irregular; temp. 101, rectal; skin cold and leaky; she is restless, seemingly irrational, and at times semi-comatose. She has the appearance of shock. General physical examination: Heart and lungs negative. Systolic blood pressure, 140, diastolic 90. A red area about one-quarter inch in diameter is noticed on the right breast about an inch to the left of nipple. The patient seems to react when this area is pressed, but there is no palpable tumifaction. The abdomen is slightly distended and somewhat tympanitic, but seemingly not painful. Vaginal examination: A thin, bloody exudate is noticed at the vaginal orifice, which is relaxed. Digitally there is felt a relaxed, scarred perineum. A number of odoriferous clots are found and removed from the vagina. The cervical os is dilated about half an inch, and presents a hard fibrous margin. The cervix itself is bilaterally lacerated. There is presenting at the cervical os a mass, presumably placenta. The uterine fundus is soft and distended to about an inch of the umbilicus. Further bimanual examination is negative. The patient shows no reaction to digital examination, as she is practically unconscious.

After considerable urging the family consented to her removal to the Methodist Hospital. She reached there about 9 p. m., and the usual pre-operative procedure was followed. Blood examination: Red blood cells 2,064,000, white blood cells 27,600, poly. 87 percent, small 11 percent, large 2 percent. Urinalysis: Albumen, plus one; otherwise negative. Husband's and two other individuals' blood proved incompatable for transfusion. Vaginal smears: Negative for G. C. The patient's condition at this time was so desperate that it was a problem whether local interference would be of any avail. She was given an intravenous of normal salt solution, and camphorated oil hypodermatically, and reacted sufficiently that by midnight it was deemed safe to proceed. Pulse was 160, temp. 99.2 axillary (so taken on account of proctoclysis). Under very light gas and oxygen narcosis (because of restlessness) a non-adherent placenta of 2½ or 3 months development, and a number of large odorous clots were removed from the uterine cavity, which was then swabbed with 50 percent tr. iodine in alcohol solution, and firmly packed with gauze saturated with similar solution. One cc. of obstetric pituitrin was given and the patient removed to her bed. It might be stated here that there was no further uterine hemorrhage. The usual post-operative method was followed. June 19, 1921, 6 a. m., temp. was 100 3/5 rectal; pulse 164; pupils slightly dilated, and patient comatose. Condition critical. June 19, 6 p. m., temp. 102 rectal; pulse 130. General condition unchanged. June 20, 6 a. m., temp. 100 3/5 rectal; pulse 120. Patient restless, but seemingly unconscious of her surroundings. Uterine pack removed, no bleeding. Blood examination report: Hemaglob. 24 percent, red blood cells 1,712,000, color index .7, white blood cells 27,000, poly. 86 percent, small 10 percent, large 2 percent, trans. 1 percent. Quite a few nucleated red blood cells. Polychromatophilia. At 2:30 p. m. of this day she had a chill. Temp. 103 3/5 rectal, pulse 120

and bounding. Patient still unresponsive. At 5:30 p. m., temp. 104 rectal; pulse 118. We had been making effort to obtain a suitable blood donor, and late that evening were successful in finding one in the person of a young woman who weighed about 80 pounds, claimed to be 18 years, but looked about 14 years old. By 3 a. m., June 21, temp. 107 6/10 rectal, pulse 162. A blood transfusion (citrate of sodium method) was begun, but after about 200 cc. of blood had been drawn from the donor, she unfortunately collapsed, and no more blood was obtainable. However, this amount was given to the patient. June 21, 6 a. m., temp. 101 4/5 rectal, pulse 112. Blood examination report: Hemaglob. 25 percent, red blood cells 1,932,000, white blood cells 35,800, poly. 95 percent, small 2 percent, large 3 percent. At 6 p. m., temp. 101 4/5 rectal, pulse 100. June 22, 6 a. m., temp. 101 4/5 rectal, pulse 88.

At this time, four days after entering the hospital, the patient was conscious and seemingly rational, and stated she had no recollection of having seen me before and did not remember anything that occurred since about noon of Saturday, June 18. From this time on the temperature did not rise above 102 rectal, nor the pulse above 115, and by June 29, temperature and pulse became normal and remained so thereafter.

On June 23 the reddened area on breast became more painful, and a distinct tumifaction was noticed. On June 24 this had enlarged, fluctuated, and about noon ruptured spontaneously, evacuating—according to nurse's report—a pint or more of foul-smelling yellow pus. Microscopic report: Mixed strepto- and staphylococcus, strepto predominating. The abscess cavity was packed with hypertonic salt solution saturated gauze, and by June 29 the discharge had stopped, and the wound was practically healed.

The blood examinations for June 23, 24, 25 and 29 were as follows: June 23: Hemaglob. 25 percent, red blood cells 1,360,000, white blood cells 18,000. June 24: Hemaglob. 26 percent, red blood cells 1,760,000, white blood cells 16,000. June 25: Hemaglob. 26 percent, red blood cells 1,664,000, white blood cells 19,200. June 29: Hemaglob. 35 percent, red blood cells 1,768,000, white blood cells 10,000. June 23, report on blood culture, negative after 72 hours. Vaginal discharge, negative after 72 hours.

The patient was able to leave the hospital June 30, 1921, and at this time has fully recovered.

I am frank to state that I consider both of these cases somewhat atypical, for in case No. 1 the question arises, in view of a past history of malarial fever, whether the hypertherma was malarial or not, and in case No. 2 whether the sepsis was primarily genital or from the breast.

DISCUSSION

DR. JOSEPH H. WEINSTEIN (Terre Haute): We have two distinct schools in this condition. One idea is to leave them alone in every instance; the other is always ready to do something, perhaps too often.

I think one very, very important thing that is not infrequently overlooked is the previous history—to know whether the infection is primarily puerperal, or gonorrheal in origin. Of course if it is gonorrheal in origin we are much safer in any operative procedure than if it were puerperal. These cases are fairly safe if they are left long enough. Frequently they cannot be reached from below, even though a fair quantity of pus may be present at some place, and entering the abdomen early is usually fatal.

Pulse and temperature are extremely important. We may have a case with a fairly high temperature, but if the cardiac condition is satisfactory I think we can safely wait on this case, and with the expectant treatment we will get better results. We cannot always tell whether the uterus is empty in any of these cases. They frequently will retain vile smelling clots and there will be no secundines present at all. The cervix may be contracted, retaining the clots, which will decompose and produce symptoms in the same way as retained placenta or the product of conception. So I do not subscribe to the school that believes in letting things alone too long. If the case does not respond fairly early, I can see no harm in very carefully dilating the cervix, as Dr. Jaeger says, never using the curette. We can use a wire pool, a sponge forceps, or something like that, which will do no harm to the uterus and will not open up any new avenues of absorption.

I think it is extremely important to determine the extent of the infection. If we have a peritonitis and infection is outside of the uterus and has entered the general system, then we have a septicemia, and I cannot conceive what good any surgical procedure is going to do outside of being certain that we have drainage of the uterus—that is, outside of general treatment that should be instituted.

In the case the doctor spoke of, in an anemic condition from whatever cause, transfusion is absolutely indicated; but in the average case I should hardly think that necessary although hypodermoclysis or proctoclysis would be indicated. The Fowler position and hypodermoclysis has done more than any other two measures towards curing these cases of infection.

I do not like to use irrigation of the uterus at any time, whether on the operating table or during the after treatment. I really do not believe it is necessary to use a tube in the uterus.

I think with the cervix thoroughly dilated you will have sufficient drainage, especially if pituitrin is given and that is followed by some tonic treatment with iron, nux and ergot.

I was much interested in the remarks of the doctor about the experiment with shot bags, etc. I never heard the matter presented in that way before, and there may possibly be something in it, if it acts as a splint to the abdomen, the same as morphine or opium acts as a splint internally.

DR. G. FRANK HOLLAND (Bloomington): I imagine this is the method followed by most of us in the care of these cases, especially those with immediate signs of infection. I have not used a sharp curette in these cases for a great many years, using iodine and plain gauze. I do not use the tube; I do not use irrigation in clearing out a uterus. Many times in the first hours of signs of infection we may be able to get sufficient dilatation to permit the removal of secundines with the index finger. I prefer blunt forceps, because you can much better differentiate that portion to which it is adherent and avoid greater physical damage to the uterus already infected and soft. In fact, I wonder sometimes at the success of the man who uses a sharp uterine curette. I congratulate him, because it is almost equivalent to scraping the inside of a wet paper bag.

External infections are found, many times, with rapid pulse, high temperature and increased pressure. I remember one case of diphtheria of a very slight tear in the perineum. The case had already been curetted and was found to be a local infection of the rent.

One of the problems of these tube cases that comes to all of us is the fact that so frequently you will find the doctor blamed as the cause of the sepsis in the case. In the case cited by Dr. Jaeger it could not have been attributed to that, but in many cases they say the doctor did not give the right care. They fail to consider the almost uniformly poor care given obstetric cases in the home. You will not find this type of infection so common in the hospitals. As you know, where there is a miscarriage there is no preparation and almost anyone is called in to assist. They are often the source of infection.

DR. A. S. JAEGER (closing): The reason I took this subject for discussion is because I believe it is at present of great importance and I do not think there have ever been so many cases of septic infection resulting from premeditated or accidental abortion, or miscarriage, as within the last five years. We can readily see how this has happened as a result of wartime infatuations and of hasty marriages, and many parties to such have taken the law into their own hands as to how many children they shall or shall not have. As a result of present economic conditions we will get such cases more frequently for some time to come and we must decide what is the most rational treatment to pursue.

I believe Dr. Weinstein misunderstood me. I do not use blood transfusions only when the patient is *in extremis* because I believe that introducing new antibody formation factors directly from healthy human blood will more rapidly than any other means stimulate in the recipient's body an ability to overcome the infection.

I do not use the tube in every case, but only where it is absolutely needed, because in these cases I cease to feel that I am dealing simply with a uterus, but rather with an infected cavity, and I want the infective material washed and drained out. It is not imperative to use irrigation through the tube, but if there is contraction of the cervix without adequate provision for drainage one may have trouble.

Another interesting fact is this: In the last three months in my City Hospital service I have had considerably more than the usual number of acute inflammatory pelvic cases. Unfortunately our drug clerk was ill and not being able always to procure suppositories we had a chance to decide the difference between our opium combination in the rectum and morphine hypodermically. In the cases in which we were able to use suppositories, the patients were practically well in two or three weeks. In the case where we used morphine it took five or six weeks to obtain the same result.

NON-TUBERCULOUS INFECTIONS OF THE KIDNEY*

P. E. McCOWN, M.D.
INDIANAPOLIS

Much has been written on pus infections of the kidney, but the importance of the renal function to the body economy is so great that we hope another contribution on this subject will be of interest.

The difficulties of diagnosis without instrumental examination are sometimes unsurmountable. However, if kidney disease is suspected, in most cases it will be easy to arrive at the truth by ordinary methods. If early diagnosis is made and the proper treatment instituted more kidneys will be saved from total destruction.

The kidney as an excretory organ is of necessity affected by the general diseases of the body. Infections of the nose, throat, apical abscesses of the teeth, appendicitis and intestinal fermentation or any non-draining focalized infection give up bacteria and toxins which are at least partially eliminated through the renal tubules.

(1) *Exciting causes*:

(a) Mobility. Kidneys loose in the abdomen receive more or less traumatism in addition to the embarrassment of their blood supply

*Presented before the Section on Surgery of the Indiana State Medical Association, Indianapolis Session, September, 1921.

by the twisting of the pedicle, and furthermore by ureter kink, checking the free drainage of urine.

(b) Likewise external traumatism will lower the resistance of the corticle and pelvic portion of the kidney to the point of permitting the growth of bacteria.

(c) General debility. It is a well established fact the normal kidney will pass numbers of pathogenic bacteria through its tubules with no ill effect to its tissue. Debilitating diseases so reduce the functioning power and resistance of the kidneys as to make them very susceptible to pathogenic organisms.

(2) *Bacterial causes*:

(Scheidemantel Muench. Md. Wochenschr. 1913, Page 1722.)

Scheidemantel found in the examining of one hundred mild to moderately severe cases the bacterial cause to be colon or colon-like bacilli 84, bacillus-proteus 3, para-typhoid 1, influenza 2, diplococcus 1, staphylococcus 2, mixed colon and coccus 4, streptococcus 2, pyocyaneous 1. We find our own cases run very close to this percentage, except that we have had two cases of pyocyaneous and several cases of streptococcus infection.

The men who have studied the source of infection in the kidney are coming more and more to believe the blood stream is the vehicle of most infections. Since blood culture has been more extensively used this has been emphasized, for we have been able to demonstrate in the blood the same organism that is cultured from the original source of infection, and from the catheterized kidney urine.

The kidneys are richly supplied with lymphatics and have a fairly definite chain communicating with the ascending and descending colon as shown by Franke (Grenzgeb, d. Med. u. Chir. 1911 XXII, 623), but it seems that the lymphatic flow is from the kidney instead of toward it.

Eisendrath, of Chicago, worked out a chain of ureteral lymphatics ascending from the bladder to the kidney, but Cabot and Crabtree examining the same sections believe that this chain was not direct to the kidney, but drained into glands external to the ureteral walls. Thus it would not seem likely that the kidneys would easily receive infection through their lymphatic channels.

The question of infection ascending from the bladder through the lumen of the ureter has been debated pro and con for many years. It has been shown as quite unlikely in normal ureters for bacteria to progress against the downward flow of urine. However, in the presence of urethral stricture, enlarged prostate or other causes which produce an increased intra-bladder pressure it would seem possible for the ureters to dilate and lose the vermicular expulsive wave normally found. We have a slide which demonstrates this condition. The urine from this dilated ureter was sterile and the man went through a prostatic operation without kidney infection, but it is our opinion that the colon-bacilli in the bladder would have invaded the ureter and advanced eventually to the kidney, had not the bladder neck obstruction been removed. Keyes in his Urology, very strongly insists that ascending infection is improbable, preferring to believe that the prostatic or bladder infection is carried by the lymphatics into the blood stream and re-excreted by the kidneys.

One other source of infection to the kidney is that of irruption from neighboring organs, such as diaphragmatic or hepatic abscess. These, of course, are rare.

Briefly the pathology of kidney infection is that of reddening, inflammation, congestion and swelling of the tubules and mucus membranes. The coccus infections seem to show predilection for the corticle portion of the kidney, while the colon bacilli are usually found in the pelvis and about the papillæ, each producing abscesses which eventually coalesce and empty into the pelvis. We hope to demonstrate by our lantern slides the various degrees of kidney change produced by these infections.

The symptoms of this disease are many, varied and often misleading. In the mild cases we may have frequency and possibly a burning upon urination, general malaise, loss of appetite, with none or a very small rise of temperature. These symptoms may be absent and the patient merely complains of a foul, turbid urine or a urinary sediment. Examination of such a urine specimen may show pus or only a large number of bacteria. The specific gravity is usually low. Pain or aching in the loin may be the only symptom, however, it will be well to discount the numerous other causes of backache by making an urinalysis.

We have recently had two cases who came because of symptoms of urethritis. In determining the cause of urethritis urinalysis was made and evidence of kidney disease found. The beginning of the kidney infection may be masked by the symptoms of such other diseases as tonsillitis, scarlet fever, typhoid, etc. Thus it would seem well to examine the urine occasionally during general infectious diseases without waiting for some specific indication.

In moderate to severe types there may be a sharp rise in temperature, and this frequently happens as the symptoms of the general disease are subsiding, leading one to suspect an extension or exacerbation of the tonsillitis, scarlet fever or typhoid fever. At this stage you should palpate the loins for tenderness and make an urinalysis. The temperature curve is irregular and may be interrupted by intense chills. In the very severe cases these chills may be as frequent as two or three times a day, racking the

heart and leaving the patient exhausted. The sub-costal pain is usually severe, but in rare cases that may be entirely absent, or vary with the degree of intensity of infection.

Pyelitis in infancy and childhood is more common than generally suspected. Danforth (S. G. & O. March 1920 XXX No. 3) speaking of the experience of the Gynecologic-Obstetric service of the Evanston hospital, makes the following statement: "The number of instances in which pus has been found in the urine of infants a few days old has been striking. It seems fair to assume that many unrecognized and therefore untreated infections of the kidney may be the starting point for urinary lesions of a more serious character in later life, and it is suggested that a careful routine observation of urinary findings during the first week of life in maternity hospitals and the active routine treatment of urinary infections revealed thereby would serve as a preventative measure of considerable value."

The onset is usually sudden and we find the child restless, flushed and feverish. There is rapid loss of strength and weight. The temperature curve shows all variations. If old enough, they will complain of abdominal pain, frequency and pain on urination. The urine will be of low specific gravity and show varying quantities of pus, the extreme cases will show a very high temperature, followed with prostration and death.

The common occurrence of pyelitis in pregnancy would seem to merit some discussion of the symptom syndrome in this condition. It is not uncommon to ascribe the urinary frequency in pregnant women to the growing tumor, or to the nervous and frequently unhappy condition of these patients. Pain in the loin is usually a prominent symptom even in the milder infections and should be an indication for a careful urinary examination. Urinalysis in women is of little value unless it is of a specimen catheterized directly from the bladder. It is well to remember that there may be no urinary symptoms, but should the bladder be involved with kidney infection the act of voiding may be very frequent or almost continuous. The general symptoms of temperature, chills and sweats will vary with the degree of the intensity of the infection. In this form of pyelitis as in other types there may be a complete closure of the ureter and temporarily there will be no pus found on urinalysis. This has occurred several times in our practice and in one notable instance of a woman of seven months' pregnancy there was a large abdominal tumor of the right side, which pushed the fundus of the uterus beyond the mid-line. Urinalysis in this case showed a small amount of albumin in clear urine, a few blood cells, and a few hyaline casts. This urine was later found to be coming from the left kidney. By cystoscopy and ureteral catheterization we withdrew in twelve hours sixty-eight ounces of thick purulent urine from the right kidney, and had a complete subsidence of the right sided tumor formation. While in this case the temperature was not high, yet we have had several patients in the last few months that when the ureter block came on, the temperature rose to 105 and in one instance to 107. There may be no urinary frequency or burning in this condition, in fact the diagnosis may be extremely difficult, as the pain may not be in some instances proportionate to the gravity of the condition. Ureter blocks may present all the dramatic symptoms of the so-called acute abdomen, and it will require a fine degree of discrimination of the surgeon to accurately diagnose it. In fact we are coming in contact with cases who have had appendices removed, gall-bladders drained and every other manner of abdominal operations performed without relief in the presence of a kidney condition. It is well to remember in severe kidney diseases that we usually have a dry, red tongue, and in cases of extreme infectious toxemia we have seen vomiting frequently occur. Increasing drowsiness, hiccough, coma and convulsions may be the terminal symptoms.

Renal infection should be suspected in the presence of fever and toxic symptoms with obscure cause, especially if a pyuria or bacteriuria exist. Backache should be thoroughly investigated with the idea of the possibility of kidney disease, always remembering that the urinalysis may not show much in the way of pus in the beginning condition, or should there be ureter block. In the physical examination always palpate the loin in the endeavor to evoke tenderness in the costa-vertebral angle.

Deep abdominal palpation with counter pressure in the loin often discloses a large and tender kidney or a dilated pelvis full of pus. The pain of this condition may be present in the plane of the gall bladder on either side. It may be referred to a level of the appendix on either side or, as is well known, may radiate from the kidney along the course of the ureter into the testicle and inner side of the thigh.

In renal infection the urine will show a disproportionately large amount of albumin relative to the number of casts. Pus cells or bacteria will usually be found. It may be regarded as axiomatic that pus with a large amount of albumin with few or no casts indicates renal infection. Pus may not be found: (1) In very slight renal infection, (2) in the hyperacute focal suppuration pus may not be delivered into the kidney pelvis, in other words we have a true kidney suppression, which may be partial or total; (3) inflammation may block the ureter withholding pus temporarily or permanently from the bladder urine. In the latter two conditions we may have all the symptoms of the acute abdomen and the diagnosis cannot be made certain without the use of a cystoscope and ureter catheter. Such an examination will

show whether there is pus in either kidney urine, whether there is obstruction in either ureter, and if the catheters pass freely to the kidney we can demonstrate the quantity of urine excreted by each, the quantity of urea eliminated by each and the ability of the kidney to eliminate phenol-sulphone-phthalein or other diagnostic dyes. These tests are usually successfully made, even though the catheter enters the ureter but a few centimeters.

The x-ray combined with ureteral catheterization has been of an inestimable value for discovering stones and the degree of destruction in the diseased kidney. It also discloses to us displacement of the kidneys, stricture of the ureters, kinks and other distrophies found associated with and causing kidney infection. We hope to illustrate the advantage of combined ureter catheterization and x-ray examination by our lantern slides.

Cystoscopy and ureter catheterization is the best method for finding the source of pus in the urine. We can segregate the infected urine from one or both kidneys and differentiate it from simple cystitis, prostatitis or seminal vesiculitis. It is also obvious that this is the best method of differentiating kidney disease from other abdominal affections.

Favorable prognosis in these conditions depends to a great extent on early recognition of the disease and the institution of proper methods of treatment. Failure in this respect brings on the severe destructive lesion which necessitates sacrificing the kidney. Even in the presence of ureter kink or stricture we are frequently able to re-establish good drainage from the kidney and secure a return of function, with an abatement of the infection. In bilateral pyelo-nephritis the prognosis is more grave. However, in this condition we have several cases which, with kidney lavage and hygienic treatment, and internal medication, we seem to be able to keep in a fair degree of good health even in the presence of undilatable ureteral strictures and permanent kinks.

Diet and Hygiene. It is well to remember in kidney disease that heavy ingestion of food or considerable exercise adds to the load of a crippled organ. It would seem best to reduce the diet to a point only sufficient to maintain a comfortable existence. By this we mean a reduction of the total diet and not the entire elimination of the proteins. It is a good rule in most all urinary infections to prescribe the drinking of large quantities of water. In the matter of diet we may well be guided by the degree of kidney insufficiency and intensity of infection and fever. Keeping the skin warm and moist increases the elimination through this avenue and decreases the material the kidney would otherwise have to excrete and thus lessens its congestion.

Hexamethylamine thirty grains daily as an average dose, but varying with the age of the patient and the degree of intensity of the infection, should be administered. The coccus infections usually flourish in the alkaline urine, so the addition of acid sodium phosphate, thirty to sixty grains a day, or sodium benzoate, will increase the effectiveness of the hexamethylamine. Conversely, the colon bacillus flourishes in an acid urine and a short period of alkalinization will be of assistance to its destruction.

In our treatment we must not neglect the possible causes of renal infection. If it follows the contagious and infectious diseases as scarlet fever and typhoid fever, of course treatment for these conditions have been previously established. But if its origin is unknown we must search out and eradicate the diseased teeth and tonsils, we must dilate the urethral strictures, we must remove the obstructing prostatic growth or eradicate the infection of prostate and seminal vesicles. Colitis and rectal abscesses and infection must be properly treated.

Congenital atresia of the urethra and ureter will require dilatation. A diverticulum can compress the ureter to the point of producing obstruction. We have recently removed such a diverticulum and will demonstrate by pyelogram the damage caused to the kidney and ureter.

Kidney lavage with the various solutions of vitillin silver or silver nitrate has been a great aid in the elimination of infection, mainly confined to the kidney pelvis and papillæ. The act of passing the ureter catheter or bouge, straightening kinks and dilating strictures or leaving a catheter in the ureter for hours at a time, has been of great assistance in relieving acute symptoms of high fever and toxemia.

It is possible to cystoscope children and there are instances of persistent infection, possibly aided by congenital atresia, which will be benefited by ureter catheterization and pelvis lavage.

Finally, in the fulminating cases where it is not possible to establish drainage of the kidney by ureter catheterization, nephrectomy or nephrotomy must be done. If at operation the kidney is found in bad condition extirpation is best, if the condition of the patient will permit an operation of such magnitude. In the very weak patients nephrotomy, with the establishment of drainage, and secondary nephrectomy may be a procedure of choice. Pyonephrotic cases especially with peri-nephritic abscesses will require a nephrectomy.

DISCUSSION

DR. CHARLES E. BARNETT (Fort Wayne): In the last portion of this thoroughly commendable paper the essayist speaks of the pyelitis of pregnancy. Had God known that we were going to get up on our "hind legs" he would have put a groove in the sacroiliac synchondrosis

sufficiently deep in the female to allow the ureters to bury themselves away from the pressure of the fetal head during pregnancy, thus avoiding subtotal ureteral block, or incomplete renal drainings. I have frequently made the statement that faulty drainage is the cause of nine-tenths of all disease.

One portion of the paper that is especially impressive is that showing Scheidemantel's statistics of 84 percent of bacillus coli infections. This tells me that the mucous membrane of the alimentary canal with its tributaries to other viscera contribute all but 16 percent of our infections—teeth, tonsils and all other infections only 16 percent. So a careful intake in the alimentary canal with thorough drainage would tend to eliminate 84 percent of kidney infections.

DR. BERNHARD ERDMAN (Indianapolis): It seems to me, as Dr. Barnett has said, that we all know this question of kidney infection is very largely that of all other renal infections—a question of drainage. These patients who have kidney infection have varying symptoms. Our greatest misfortune perhaps is that we see them too late. The instances of individuals who have kidney infection as a result of mechanical disturbance are quite numerous, and they can be taken care of by mechanical means, but the question of infection due to bacterial invasion is of the utmost importance.

I want to speak of these statistics of 84 percent of infections due to bacillus coli. You may say that bacillus coli is a rather common infecting organism. I believed it practically always present in acid urine until a few years ago when Dr. McDonald called attention to the use of large quantities of alkali, thus changing this reaction. This has been worked out very completely within the last few years by some of the men in the Brady Institute.

A well recognized procedure is lavage of the kidney pelvis, and attention to focal infections and intestinal tract infections is well recognized among those of us who do more or less of this work. But there are a few factors which I think should always be borne in mind. These individuals have almost invariably pus in the urine. There are exceptions, of course, where this pus is closed off temporarily. But a simple examination of the urine will, in a vast majority of instances, afford us a considerable amount of information. Frequently we have, in addition to the pus, bladder irritability and pain.

If the infection invades the kidney, it is questionable how much value we may get from lavage. We can lavage only the pelvis of the kidney. When we induce a solution into the kidney pelvis under such pressure as to bring about dissemination of the fluid within the mucous membrane itself, it is questionable whether we will benefit or damage that patient.

O'Conner, at the American Medical Association, brought out some interesting points in relation to the injection of substances into the kidney pelvis and allowed to remain a given length of time. The new dye substances we are getting hold out some advantage in the relief of kidney pelvis infection, but if these infections extend down into the substance of the kidney we will not get much benefit from these.

Attention to the patient's general physical condition is an important factor in the treatment of kidney infections as in other conditions.

DR. H. O. MERTZ (Indianapolis): Dr. McCown emphasized in his paper our ability to detect anatomical variations in the ureter and pelvis by means of the pyelogram. It is not necessary to reiterate the need for such findings in cases where we contemplate operation, but, as indicated in the discussion of this paper, there are problems involved at the other extreme meriting further emphasis. I refer principally to those factors which influence the localization of the infection in the kidney, and which tend to prolong the infection. The mass of the germ as we study it does not have to be large. It is the exciting factor in our infective process; but the thing that is predominant in a majority of these cases is the predisposing factor, that something which interferes with our drainage, and if we are going to study the problem with the idea of being able to forestall the development of a renal infection and accurately establish a rational procedure in the treatment of a renal infection, when once established, with the idea of limiting its progress or completely eradicating it, we must limit our discussion very largely to the subject of the causes of urinary stasis. If the stasis is sufficient that we can accurately detect residual urine by the ureteral catheter, our problem is simple. In the treatment of such cases I sometimes doubt whether one particular drug in the use of irrigation has any virtue over another. I think it is very much a problem of overcoming obstruction in the ureter. I recall one case in which ureteral catheterization had been employed for six weeks, because of a pyonephrosis associated with pregnancy, and there had been no irrigation of the pelvis except to dislodge pus and mucous from the catheter and the temperature remained normal throughout the course of this treatment. It was not the result of any medicine in the pelvis, as none was used, but the direct result of mechanical relief afforded by the relatively stiff catheter in the ureter.

It would seem the urinary stasis is a frequent cause of the localization of an infection in the kidney through its lessening local tissue resistance and it is equally true that urinary stasis is a frequent accompaniment of an established renal infection and no doubt materially contributes to its duration, and must be considered in formulating any plan of treatment.

DR. D. F. CAMERON (Fort Wayne): I would like to emphasize the rapidity with which the

contents of a kidney pelvis are absorbed when the ureter is occluded. In two and a half to three hours after a kidney pelvis has been filled experimentally with a sodium iodid or bromid solution as is used in pyelography and the ureter occluded, the contents of the pelvis remaining give no test for iodin or bromin. All of it has been absorbed and the test for the salt is positive in the urine secreted by the remaining kidney. Similar results are obtained when dyes and India ink suspension is used. This explains why there is such a febrile reaction in cases of pyelitis with poor drainage when the same infection in the bladder where there is practically no absorption produces little or no reaction.

Personally, I cannot understand why the use of solutions of silver nitrate for pelvic lavage is so popular when it is realized that it is precipitated by the salts in urine and deposited in the kidney parenchyma where more or less focal necrosis is produced. I believe the dyes Dr. Erdman spoke of or similar substances would be preferable.

I was pleased to note that the fine pyelograms shown were made with sodium solutions which I introduced for pyelography.

REPORT OF APPENDICITIS CASES*

JAMES Y. WELBORN, M.D.
EVANSVILLE

This report comprises the most of the cases of this type seen and treated by Dr. Edwin Walker and myself and other members of the Walker hospital staff, during the years 1899 and 1920, inclusive. I have taken this period because it includes all my work except for the year of 1921.

There were a few cases operated in the home each year; some of these are included; those which are not mentioned either had no histories or they were lost. As time went on there were less operated in the home, as it is a certainty that the best results are obtained in the hospital, where all equipment is convenient and more experienced attention can be given the patient. However, our mortality in cases operated in the home is not bad. I do not expect every case to be brought into the hospital, because there are instances in which it is best for the patient not to be moved, so we are always ready to operate such a case in the home.

The general character of these cases is "an average type"; the report is made for appendicitis alone and shows many of all types; there were some distinct cases in which other operations were done which are not counted. I am certain there were a few hundred that were complicated in gall bladder and pelvic cases.

During the years covered by the report 1,761 laparotomies have been done and I am sure that the appendix was removed in seven-tenths of them. During the past few years we seldom open an abdomen without removing the appendix. It is interesting to know that 60 per cent of all appendices show evidence of present or past infection. In gall bladder operations we do not always take out the appendix because in so many patients with a long incision there is a tendency for a gaping wound that is hard to close, so for this reason none except affected appendices are removed in gall bladder operative cases.

This series of cases covering a score of years shows variations in mortality; the causes are varied—a better surgical technique pertains in the latter half than in the first half. The physician treating the acute case now urges operation at once, wherein he formerly was more apt to follow the Ochsner treatment a few days under which treatment a certain number always became very severe—abscess or peritonitis cases. Then there is a growing tendency for people to heed the advice to go to the hospital early. The greatest factor in our decreased mortality is the "School of Experience" of the practitioner. After a physician sees one or two bellies opened which are badly stained with pus or show a badly necrotic appendix he can more forcibly persuade a patient to take radical treatment.

In this group of patients there has been no selection—all acute cases—regardless of their advanced stages, have been operated. The only ones we do not operate are those who refuse or those in which there is a distinct contraindication. Only operated cases are mentioned in this group.

It is quite instructive to the writer to know how inefficient some histories are, but it is quite agreeable to know that taking each five years as groups that the history-taking improves right along. You will see that the statistics are not complete because of inefficient histories occurring in the first ten years of the report.

I have made classifications in groups which show some interesting features. Group 1 consists of those under 20 years of age and shows a fair division in the sexes, but a greater mortality in boys; an *overwhelming* number of the gangrenous cases occurred in boys. I think this is not an end result reading because a gangrenous case let alone will usually develop a localized abscess. This idea is exemplified by the fact that we often find a gangrenous appendix in a localized abscess.

Group 1—All Under 20 Years

Boys, 156; girls, 188; total.....344
Fatalities—Boys, 14; girls, 10; total..... 24
Pus Cases 137
Gangrenous cases 41
Catarrhal cases 165

Mortality rate, 6.6%.

Practically all in this group are acute; only about twelve were chronic. We see also that

*Presented before the Section on Surgery of the Indiana State Medical Association, Indianapolis Session, September, 1921.

considering the severity of the cases they show very good resistance, but not so good as the adults in group 2, which shows a mortality rate of 1.8%. The frequency of chronic cases and early operations in acute cases in the second group are the great factors in the low mortality.

Group 2

In the 20's	552;	mortality 10
In the 30's	351;	mortality 13
In the 40's	206;	mortality 9
In the 50's	72;	mortality 8
From 60 to 88	18;	mortality 0
Unclassified ages	233;	mortality 21
	1,432	61

Mortality rate, 1.8%.

In the first group the youngest was a baby five weeks old with a gangrenous appendix in a strangulated hernia. This was secondary appendicitis; the case recovered. One child at one year and one at two years died; comparing with other young cases they do not show very good resistance under the third year.

Just to the contrary those people in group 3 are over 60 and show almost perfect resistance; these were ten males and eight females, eleven of them drainage cases. There were four cases over 80 years of age; the oldest was 88, a very bad abscess case. Nine of the eleven cases were abscess and two were gangrenous. The appendix was removed in all the cases.

Group 3

Over 60 years—Male, 10; female, 8.
Drainage cases, 11.
Four cases over 80 years.
Deaths, none.

Total number of drainage cases..... 566
Total number of cases of appendicitis.....1,776

The chief interest in this report is an analysis of fatalities:

Acute Septic Absorption: 5 cases. This was in the earlier days when Fowler's position, Murphy drip and hypodermoclysis were not given. We think now that there seldom ought to be a fatality from this cause.

General Peritonitis: 27 cases. No matter what the treatment is, there will be an occasional loss by this cause.

General Sepsis: 27 cases. Many in this group are more than 15 years ago and may have been acute septic absorption or peritonitis, however there will occur such cases which linger along and finally in from one to four weeks become exhausted and die of sepsis.

Pneumonia: 4 cases. These were adults who seemed to have an extension of the infection into the lung on the same side. There were several others who developed abscess and after drainage recovered.

Shock: 2 cases. One was a young adult, 16 years of age, the other was a patient 41 years of age. These were diagnosed shock and recorded as such. In reviewing the history I think they could have been distinct shock yet why not say acute septic absorption?

Pulmonary Embolism: 7 cases. This is shocking because most of these cases occurred at about the end of the second week when the patients were ready to go away from the hospital. Three of them were robust men who had had acute attacks and who had had drainage which had closed. I think the chief cause of this was either a phlebitis in the involved mesentery or in those cases where the appendix lay low and adjacent to the ileac veins.

Obstruction of the Bowels: 3 cases. Usually due to adhesions; in the group some others were saved by the second operation.

Tetanus: 2 cases. Both little girls; one theory advanced was that the tetanic germ may have come from the lumen of the bowel through the stump of the appendix. I doubt this very much. We cauterize the stump with phenol as a precaution against this or other infections. One of these cases had a slight scratch on the foot eleven days previously; this I thought was a more likely cause. One of these cases did not have the phenol cautery—the other had no record of it.

Doubtful: 8 cases. This group is made from histories not having a distinct cause of death given.

Pulmonary Tuberculosis: 1 case. This case had an acute exacerbation in a very chronic case of T. B. and lived but three weeks.

Acute Dilatation of the Stomach: 1 case. This is not a recent case and I do not recall the incidents except that all the symptoms pointed decidedly to this diagnosis and death occurred about the 5th day.

Tubercular Peritonitis: 1 case. This case was apparently a case of tubercular peritonitis which originated in the appendix but was extensive when operated and the patient lived three weeks.

Uremia: 2 cases. Both cases, one 59 and the other 55 years of age, suffered from typical suppression, showing casts and albumin, therefore nephritis was the attributed cause.

Coma: 1 case. I have not the sufficient data to explain this case, but think it was acidosis.

Empyema: 1 case. This was one of secondary infection of the pleural cavities and death occurred without drainage of the pleura.

Conclusions

Early diagnosis is the very most important thing, for until the diagnosis is made, an operation is not even thought of.

The old theory of considering the time of the beginning of the disease is not reliable because we find in most of these cases it is difficult to tell when the disease began, especially in children. One of the causes for many severe cases is the purging of the bowel by the practitioner the first two or three days; this is when there is abdominal pain which is due to peritonitis.

This gives the disease a chance to advance during the effort to move the bowel by purgatives.

A great many of the abscess cases and some of the advanced peritonitis cases that come in are those that have been treated by the "starvation" method, usually called the "Ochsner Method". Many physicians who believe in operations follow this until the case is very bad off, therefore I think it is a physician's duty in all cases to recommend the best treatment to be immediate operation.

Appendicitis is very frequent, many attacks mild in character are never diagnosed even by the best physicians and surgeons. Such attacks may be recurrent without becoming severe, and have caused many practitioners to consider the medical treatment.

Regardless of the symptoms, to correct the cause I think the safest recommendation is an immediate operation in all cases, but when operation is absolutely refused, then the abstemious treatment is permissible. I think we should no longer consider the third day as a criterion in judging when to operate because if an operation is necessary at all, the sooner the better. The patient will stand operations better either early in the disease or late in the disease; for instance, there is some advantage early because there is not so much involvement and the condition of the patient is prepared for its phagocytic protection. But from the fourth to the eighth day at the period, when a great many of these patients are apparenty better, there is probably less defense in the system. From the eighth to the twelfth day secondary abscesses are prone to occur and many of these cases have been brought in at that stage; at this time an operation is perfectly safe.

I find in the histories that most physicians take mouth temperatures. This is never absolutely accurate in any sickness and especially so in appendicitis. In serious illness of any type, rectal temperatures ought to always be taken. Many cases of appendicitis that have one degree of fever by mouth show four or five degrees per rectum.

Motto: "Early to diagnose and early to operate will reduce mortality statistics materially."

DISCUSSION

DR. G. D. SCOTT (Sullivan): In my short experience I have found that complications are more common in children than in adults. This I believe is true for two reasons. First, peritonitis is more common in children than the walled-off abscess. We do not have the protection of the wall and get more rapid absorption. Second, we have a higher position of the appendix in children that we do not have ordinarily in adults. Very often we find the appendix as high as the gall bladder, sometimes even around the stomach on the left side. Peritonitis in this region is dangerous, because of the rapid absorption of toxic bodies through the stomata peritoneal surface of the diaphragm. Recently I had two cases of appendicitis in children following a tonsillectomy. In both cases, appendicitis developed within less than one week after the tonsillectomy, and in both the tonsillectomy was preceded by acute tonsillitis. In both cases there was diffuse peritonitis, and in one, post-operative intestinal obstruction which was relieved by a secondary operation.

As to the cause of the mortality in appendicitis, I believe there are two primary causes. One is delay on the part of the attending physician or the patient, and the other is the use of cathartics. I believe there are more people killed by the use of castor oil and salts than any other drug.

I fully agree with the essayist as to the time to operate, and that is as soon as the diagnosis is made. I cannot see any indication for expectant treatment when an abdomen is filled with pus. Open the abdominal cavity under nitrous oxide and local anesthesia—there is but little shock even in the worst cases—and then is the time for expectant treatment.

DR. JAMES Y. WELBORN (closing): The doctor mentioned the point of diagnosis in reference to operation. If we always understood just what was inside it might be safe to wait in some cases, but I have seen diagnoses made in acute attacks which the doctor did not think were very serious; but as the doctor said, the delay increases the mortality. I have seen cases that we did not diagnose until after two or three years, the attacks were so light. But now at the second attack the operation is done. It is safer to imagine it is a severe case than to say it is a light case. As the years go by our mortality decreases, and if we keep on studying the disease I think we will lower our mortality materially.

A NEW HISTOLOGY OF RED BLOOD CORPUSCLES AND STAINING TECHNIC

E. L. DEWEY, M.D.
WHITING, INDIANA

INTRODUCTION.—Writers of histology and physiology invariably have described the red blood corpuscle as "a structureless, homogeneous mass". The facts here presented, I believe, show the falsity of that theory. My stain and technic were worked out in the laboratory by months of painstaking experimental endeavor.

My work has been seen and criticized by a few members of the medical profession. The principal criticism of this strange blood picture is: "It is very beautiful, but probably a trick of chemistry." The falsity of this criticism is proven in the following manner:

1. A specimen of blood fixed and stained by my method, decolorized by acid alcohol and re-

stained with one of the blood stains in common use, shows no appreciable injury histological or otherwise to the red blood corpuscle.

2. Blood fixed and laked by the usual technic and stained with my stain gives a picture of the red blood corpuscles normal in every respect as we have been accustomed to seeing them.

3. My staining shows in nearly every specimen red blood corpuscles that have been injured in making the smear, in which some of the segments have been broken loose and are seen just outside of the injured corpuscle. Proof that they existed and were there before fixing or staining.

4. Over acidity of my stain with carbolic acid causes the corpuscle segments to shrink into globular forms of various sizes, appearing on the surface of the red stained corpuscle as pale neutrophilic granules. The same picture occurs in over acidity with acetic acid, except the granules are basophilic.

Can any accident or trick of chemistry produce the blood picture shown here; with the various staining characteristics of the red blood corpuscles, repeated many times with uniform results? I do not think so.

The importance of this new histology of the red blood corpuscles to the medical profession in general, and to the physiologist and pathologist in particular, is obvious, and any discussion in that direction by me would be superfluous. This new histology was discovered by me December 14, 1921. E. L. DEWEY, M.D.
Whiting, Indiana, April 17, 1922.

THE RED BLOOD CORPUSCLE HISTOLOGY*.—The red blood corpuscle is a very definitely organized structure composed of a central or supporting membrane, "the structureless, homogeneous mass," which is covered completely with very delicate membraneous segments, individual and separated from each other by an entre-segmental membrane. The periphera of the corpuscle is surrounded with a delicate membrane which supports the peripheral segments. (Plate I, B.) The peripheral membrane and the entre-segmental membrane take the basic stain.

The peripheral segments are fairly uniform in size and arrangement, presenting a picture not unlike the cross section of an ear of corn, the kernels representing the peripheral segments. In the full size matured corpuscles the number of these peripheral segments varies from eleven to twenty or more. The highest number counted by me is twenty-six, the average being about sixteen. In the small and young corpuscles I have seen as few as five or six. (Plate I, E.)

The segments which occupy the central stroma of the corpuscle are irregular in size and shape. In the young corpuscle, there may be no central segments; or only one or two. (Plate I, E.) Those of the periphera occupying the whole surface of the corpuscle.

In from 80 to 85 percent of red blood corpuscles the segments all take a pale neutrophilic stain with rather a pinkish tint. (Plate I, A's.) The other percentages take a heavy basophilic stain with a metallic lustre. In some corpuscles this characteristic is manifested in all of the segments, central and peripheral (Plate I, F), some only the peripheral segments (Plate I, D), and others only the central segments (Plate I, C.); still others mixed, a portion of the central and of the peripheral segments basophilic (Plate I, H, I.) and others a segment or segments here and there, basophilic (Plate I, G, J.).

It is my theory that the corpuscle segments carry gases and perhaps fluids of the blood, and that the kind of gases or fluids carried and their reaction determine the different staining characteristics shown here.

Corpuscle segments are destroyed and disappear with the escape of their gases or fluids in all of the ordinary methods of fixing and staining blood, which eliminates any chance or possibility of showing them in the finished specimen.

DEWEY'S BLOOD STAIN TECHNIC.—Place in a graduated bottle of 400 cc. capacity the following solutions, in the order named:

Sat. aqueous solution *Eosin, W. S.*[1]...30.00 cc.
Sat. aqueous solution *Aniline Violet*[2]..60.00 cc.
1% aqueous sol. *Sodium Bicarbonate* 60.00 cc.

Place in a water bath, the water of which comes to the level of the solution, or a little above, and boil 30 minutes. Remove from the water bath and while still boiling hot add 95 percent alcohol to 300 cc. Shake well for a few minutes and set aside to cool; then filter.

Dissolve the precipitate collected on the filter paper in 95 percent alcohol by rubbing up well in a mortar. Add to filtrate and enough more alcohol to bring the total volume up to 640 cc. Add distilled water 80 cc., and 40 drops of saturated alcoholic solution of Aniline Violet**. Neutralize with 1 percent acetic acid solution. The amount to be used is determined by titration as follows: Take 1 percent aqueous solution of sodium bicarbonate 60 cc., place in a beaker and boil a few minutes to drive off the hydrogen atom and CO_2. Add three volumes of water and three or four drops of phenophthaline indicator. Titrate with 1 percent acetic acid solution until the solution shows only a very faint trace of the pink color. If tested now with litmus it will be found neutral. The buret reading will indicate the amount of 1 percent acetic acid solution which is now added to the stain.

Filter. This constitutes the STOCK to DEWEY stain and keeps indefinitely.

*Demonstrated at a meeting of the Lake County, Indiana, Medical Society, Gary, Ind., March 9th, 1922.

(1) E. Leitz, New York. (2) Merck & Co., New York.

FORMULA No. 8.—So numbered because it was the eighth formula made from the stock stain just described, and the first one that showed completely all of the segmentation of the red blood corpuscle:

Stock Stain.....50.00 cc.
1% Aqueous solution acetic acid..... 5.00 cc.
1% Aqueous solution carbolic acid liq.[3] 5.00 cc.

Mix well and filter. The stain is now ready for use. Use only distilled water in making solutions.

Acetic acid solutions used should be titrated with N/10 standardized solution of sodium hydroxide. This for the reason that over acidity of the stain, which causes failure, may be corrected. And to do this it is necessary to know the alkaline equivalent of the acid solution used in making the stain. In the formula given above, the alkaline equivalent of the acetic acid solution used was, 1.80 cc. of the acid solution was neutralized by 1.00 cc. N/10 standardized solution of sodium hydroxide.

MAKING THE SMEAR.—In this procedure, as in all others that follow, the student must remember that the red blood corpuscle is a delicately organized structure, consisting of a central or basic membrane which is entirely covered with hollow membranous segments which carry gases and perhaps some fluids of the blood; and that these segments are destroyed and disappear in all of the ordinary methods of fixing and staining. This has been kept constantly in mind in working out my technic. To preserve these delicate membranous structures, and show them in the finished specimen, the technic is herewith presented.

PREPARATION OF THE SLIDES.—Make perfectly clean by washing in water, then alcohol. Heat over an alcohol flame or Bunsen burner until all moisture has disappeared. Allow to cool.

THE SMEAR.—Prick the lobe of the ear or tip of the finger in the usual way. On the edge, near the distal end of a second slide collect a small drop of blood, press it down, drop edge first onto the prepared slide until the drop is completely flattened out. Separate the slides by a quick swipe in the long axis of the slide being smeared.

Allow the smear to dry in the air at ordinary room temperature for ten minutes.

FIXING THE SMEAR.—Immerse in Squibb's Ether[4] that has not been previously opened or used, for one hour. Remove from ether and allow to dry without washing.

STAINING.—Immerse in DEWEY's stain No. 8, from two to ten hours, according to intensity desired. Beautiful and contrasty specimens are produced in from three to six hours. If it is desired to study the blood platelets or leucocytes, the longer exposure is recommended. Wash the specimen in running water for five minutes. Dry in the air at room temperature. Immerse now in aniline oil water for five minutes. Remove and immediately plunge into a diluted solution of *Methyl Violet*[5] (made by adding a few drops of the concentrated alcoholic solution to 100 cc. of distilled water) for five minutes. Wash in running water for ten minutes. Dry in the air at room temperature. Mount in balsam in the usual way if it is desired to preserve the specimen for future reference.

The use of aniline oil water mordant and methyl violet counter stain brings out the peripheral and entre-segmental membranes, and differentiates the corpuscle segments from each other.

CAUSES OF FAILURE.—The general rule and principle, "careful attention to details," essential in all laboratory work, must be remembered here.

INDICATIONS OF OVER-ACIDITY OF THE STAIN.—Red blood corpuscles are laked by acetic acid in sufficient concentration with the giving up of blood gases and the disappearance of the corpuscle segments. A slight over-acidity of the stain with acetic acid causes shrinkage of the segments into globular forms of various sizes which appear on the stroma of the red stained corpuscle, as basophilic granules. This also is the picture when the stain is over acid with carbolic, with this difference, the granules are pearly like neutro-basophilic.

Over-acidity with acetic acid may be corrected by the careful addition of a very small amount of N/10 standardized solution of sodium hydroxide. In the case of over-acidity with carbolic acid, more stock stain may be added and acetic acid in proportion.

Before attempting to correct a supposed over-acidity of the stain be sure that all other factors that cause failure have been eliminated. The use of ether that previously has been opened, exposed to air or light, or that previously has been used as a fixative, causes failure. The corpuscle segments shrink into globular forms much in the same manner as when the stain is over-acid.

OTHER CAUSES OF FAILURE.—(1) A smear too thick, (2) Exposure of smear too long to atmospheric conditions before or after fixation, (3) Smear made on a moist or dirty slide, (4) Exposure of smear to heat above body temperature, (5) Allowing the smear to be exposed to the fixing ether too long or too short a time.

The worker with this technic and stain perhaps will save time and prevent annoyance and mistakes by setting aside a portion of a stain that has been made correctly and successfully,

(3) Phenol Liquefactum, U.S.P.
(4) Ether Squibb, for anesthesia, E. R. Squibb, New York
(5) E. Leitz, New York.

to be used as a control in making and testing new stain.

My stain seems to improve with age. The first formula that I made that was successful has been in use over four months and still gives brilliant and contrasty specimens.

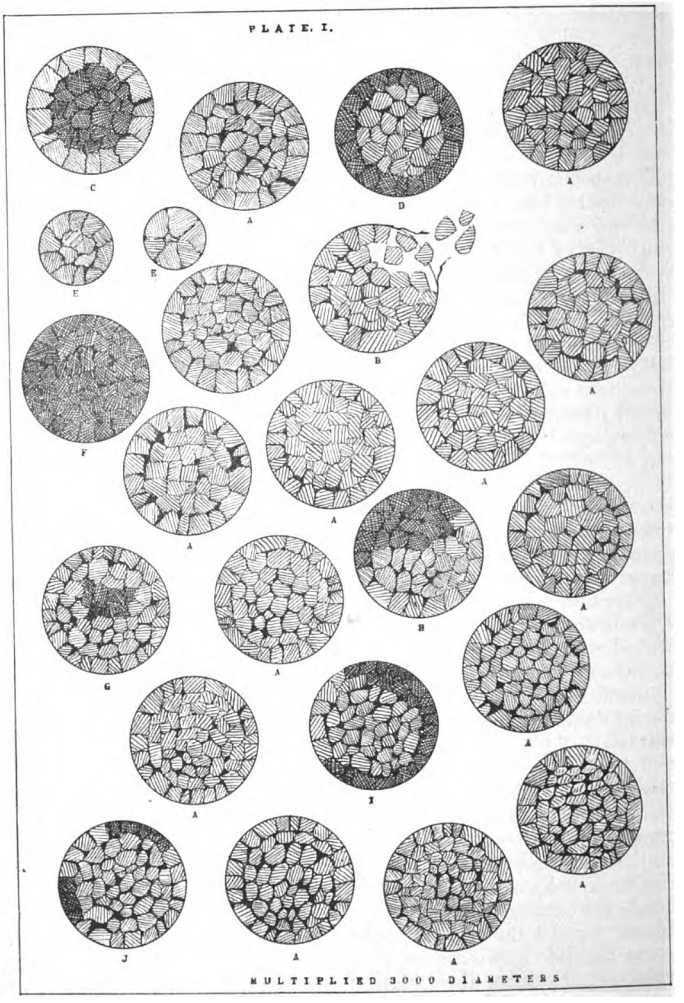

PLATE I

Drawings from microscopical specimens of normal blood, multiplied three thousand diameters:

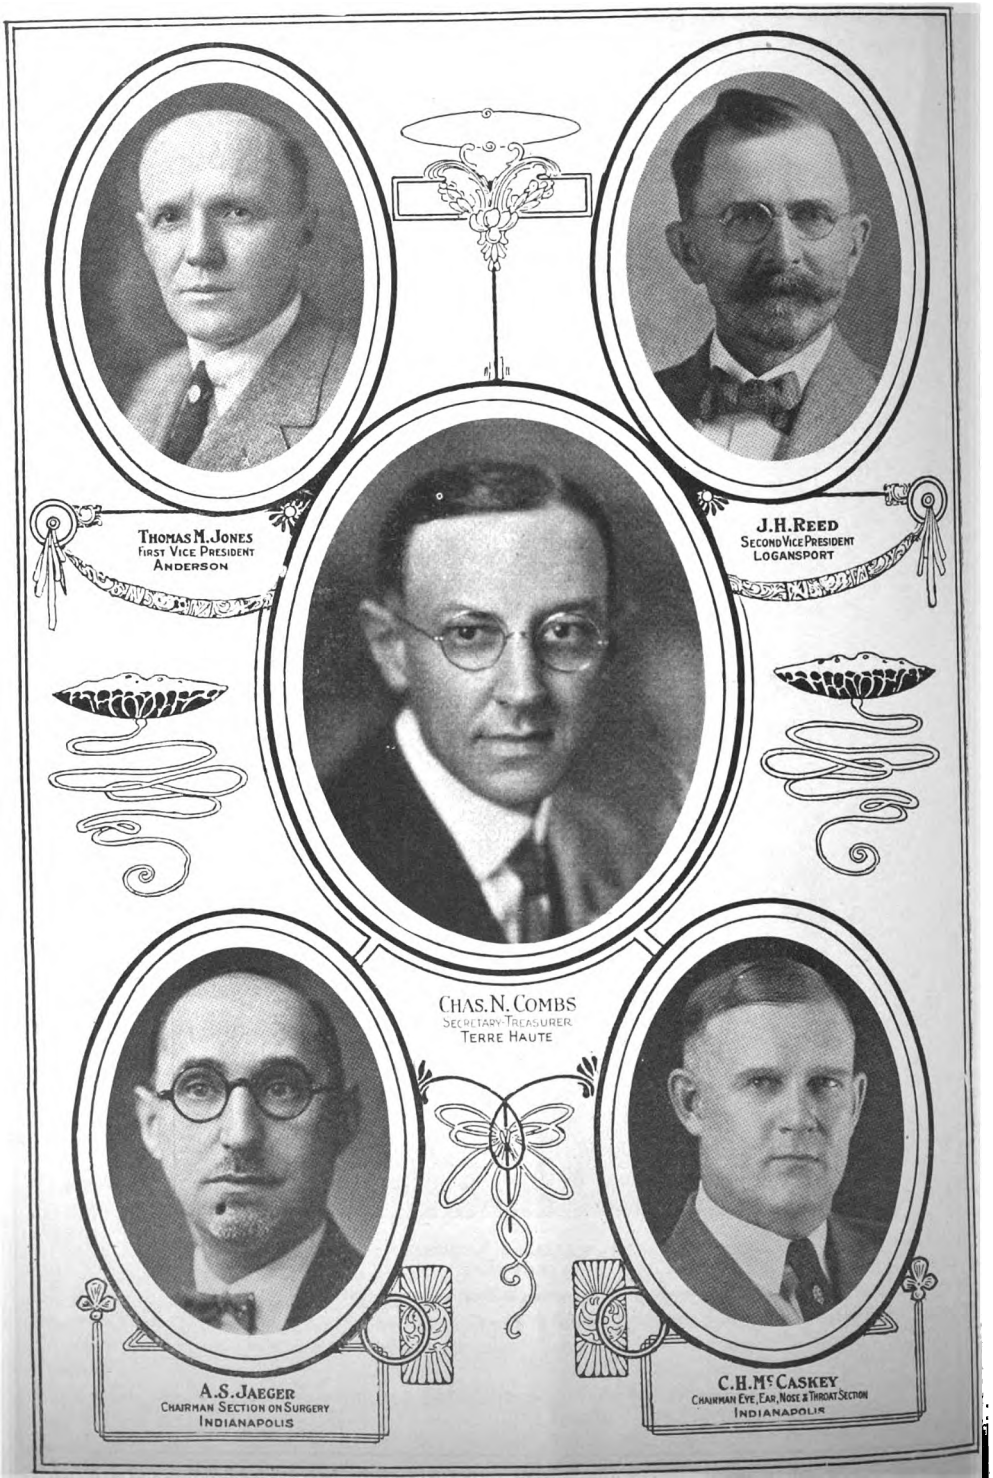
A's—Red blood corpuscles with all neutrophilic segments. F—All basophilic.

B—A neutrophil that has been injured in making the smear, showing broken peripheral membrane and displacement of corpuscle segments.

C—Central segments basophilic; peripheral neutrophilic.

D—Peripheral segments basophilic, central neutrophilic.

H, I, J—Mixed basophilic and neutrophilic



E, E—Young neutrophiles.

"THE STRUCTURELESS HOMOGENEOUS MASS".—If the student desires only to study that portion of the red blood corpuscles, then allow the blood smear to remain in the fixing ether 24 hours. This removes all of the blood gases or fluids from the corpuscle, with the disappearance of the corpuscle segments. Stain with DEWEY Stain No. 8.

Wonderful contrasty and brilliant specimens result. The "structureless homogeneous mass", taking a beautiful deep red stain evenly throughout the stroma.

MUNCIE

THE MUNCIE SESSION

On September 27, 28 and 29, the Indiana State Medical Association will meet in annual session at Muncie, as the guests of the Delaware County Medical Society, assisted by the Muncie Academy of Medicine. Although because of the renown of its medical societies Muncie is pleased to be able to entertain the state medical association, Muncie citizens always rejoice in acting as hosts to large groups of visitors as it gives them the pleasure of acquainting the guests with the general excellence of this city and of converting strangers into friends.

Muncie has interesting proof of its varied and romantic history, from the times of the Delaware tribe of Indians and Chief Munsey and Chief Tecumseh, through the struggles of the white pioneers, the gas "boom", and to the present industrial prominence, which is supported by one of the richest farming districts in all Hoosierdom. And Muncie citizens will not forbear until their guests know at least a resume of the city's history and a smattering of her present (as they consider it) approach to perfection.

By a treaty with the general government, probably the treaty of 1818, a tract containing 672 acres, lying on both sides of White river, was reserved and at the time was held by a Delaware Indian, a widow named Rebecca Hackley. The sale of this reserve to Goldsmith C. Gilbert for the sum of $960 was transacted about 1825. The settlement began to develop until, in 1837, Munseytown, or Muncietown, as it was then named, was a community of 320 inhabitants. In this year, according to the first issue of the "Muncietonian", the first publication of the locality, "A superb court house, with a cupola, etc., 45 feet square and 28 feet high, is to be built."

That the development of the transportation facilities was even then in the public mind is shown by the further quotation from the journal that "The contemplated Central Canal will pass through this place and the connecting link, either by canal or railroad, between the Central and Whitewater Canals, will in all probability terminate at this point."

In 1845, through an act of the legislature, the name was shortened from Muncietown to Muncie. In 1854 Muncie was declared by the county commissioners to be a corporate town, and eleven years later, when the population had reached 2,196, the town was incorporated as a city.

For more than three decades there was a steady growth, with the activities of the citizens tending rather to industry, when, in the fall of 1886, gas was found in the county and the famous boom was on. It was a time of wild speculation and romance which almost resembled the gold rush of the "'49ers" and the later dash to the Klondyke. Capitalists flocked in and real estate, the object of the speculation, was tossed higher and higher. The citizenry was virtually insane.

To quote from Dr. G. W. H. Kemper's historical account: "It soon became the boast that Muncie had no coal or wood yards, that twelve dollars a year paid for all the gas needed for fuel and light. Gas supply is unlimited, there is enough to last a thousand years, a well may be placed on every forty acres or even less and will continue to produce gas for all time. Such was the optimism at a time when nearly every day marked the increase of output by millions of cubic feet. For several years the people indulged in riotous extravagance with nature's gift. * * * The gas was allowed to burn day and night. At noontide, as at midnight, the roaring flambeaux that stood by the roadside and at the crossroads in the country consumed gas by thousands of feet, but never once was there a thought of checking it. The horizon was aglow from thousands of gas lights, and some farmyards were so brightly lighted that the chickens never knew the proper time to roost."

Following the cessation of the original "mushroom" boom, there began a big industrial growth which forecasted Muncie as the "Birmingham of the North". This growth was more enduring, as is evidenced by the fact that some of the industries then attracted to Muncie are still in existence and are among the leading manufactories of the city today. In 1887, the Muncie Board of Trade was organized as a corporation "for the promotion of any and all undertakings calculated to advance the interests, improvement and general welfare of the City of Muncie". It is significant that this body's first president, J. A. Goddard, is still the active head of the Joseph A. Goddard Company, wholesale grocers.

Probably the greatest factor in Muncie's industrial development was the Citizens Enterprise Company, which was organized in 1891 to promote the industrial interests of the city and especially to secure additional factories. Numerous substantial firms were thus attracted until, in 1895, despite the fact that the panic of 1893 was just past, the city had twenty-seven industries, with 5,680 employes and a monthly payroll of $241,500.

Once again there was a period of steady growth, which was quickened in 1900 when the interurban line between Muncie and Anderson was put in operation. Soon afterward cars

were run through to Indianapolis; by 1903 the traction lines north to Eaton and east to Selma were in operation; and in 1906 the Portland line was opened.

MUNCIE'S MEDICAL SOCIETIES

It is especially meet that Muncie be host to the annual session of the Indiana State Medical Association as this city is the home of two really great medical societies, one of which is among the oldest in the state and the other now undoubtedly one of the most important and one of the largest local societies in the Middle West. These are the Delaware-Blackford Medical Society and the Muncie Academy of Medicine.

The first practical steps toward the organization of a medical society in Delaware County were taken in April, 1865. Dr. S. V. Jump, president, and Dr. N. W. Black, secretary, were the first officers. The Delaware County Medical Society was later reorganized several times to conform to the requirements of the State Medical Association, but the society has never failed to exist and function. As far as can be learned, Dr. G. W. H. Kemper of this city is the only living physician who was a charter member of the body.

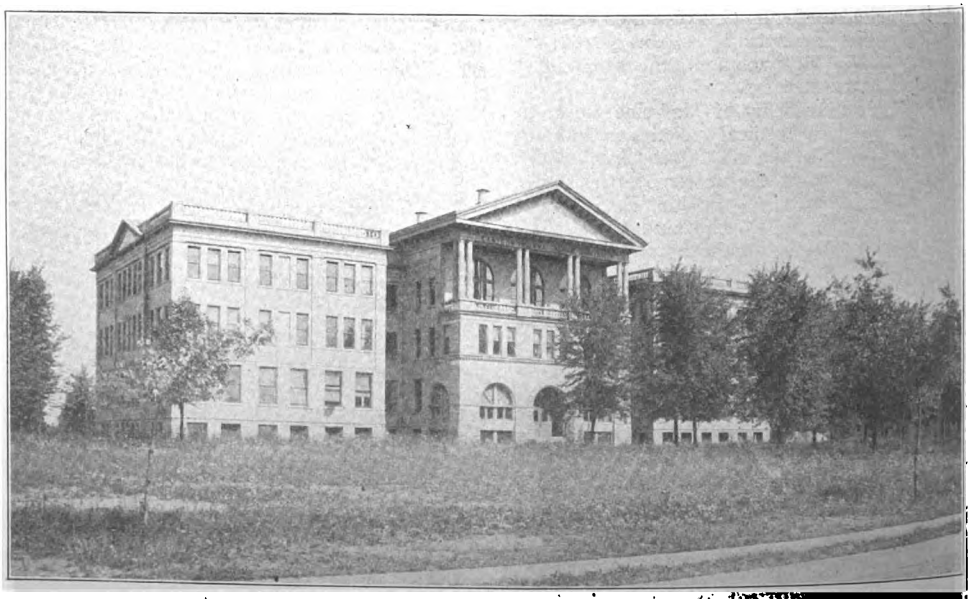
In the latter part of 1916 it was thought expedient by the officers of both the Delaware and Blackford County societies that the organizations unite, and this was accomplished under the name of the Delaware-Blackford Medical Society, which name it continues to bear. A considerable measure of the success of the society is credited to Dr. U. G. Poland, of this city, who served as secretary for twelve years, and to Dr. H. D. Fair, who held the same office for eight years.

The Muncie Academy of Medicine, now one of the largest local medical societies in Indiana, is the outgrowth of the old "Quiz Club," which had its origin during the winter of 1914, when Drs. D. M. Green, U. G. Poland, E. S. Green, O. E. Spurgeon, H. D. Fair and C. M. Mix began weekly sessions for the discussion of medical, surgical or allied pertinent topics. The weekly discussions, conducted by the alternately serving "quiz masters", attracted rapidly increasing groups, until a few months later it became necessary to reorganize and broaden the scope of the society. This reorganization was effected on October 16, 1914, and the present name was adopted. Drs. O. E. Spurgeon, president, and H. D. Fair, secretary, were the charter officers.

Changes in the programs were made as the Academy grew. In addition to the quiz, a paper on some scientific subject was read by one of the members at each meeting. Abstracts of these papers were printed in the JOURNAL of the Indiana State Medical Association, and the favorable comment received from many sources indicated that physicians in other parts of the state appreciated the work of the Academy. It was deemed expedient at this time to appoint a critic, and Dr. I. N. Trent was the first to hold this position. The critic's part in the weekly programs added much to the interest and usefulness and often the humor of the occasion. Soon physicians and surgeons from surrounding cities began attending the academy meetings and, during the past year or more, the more attractive programs have drawn attendance from all sections of the state and from adjoining states. Leading specialists from all sections of the country have addressed the meetings. All of the most prominent medical schools have furnished a large quota of speakers, whose presence is in constant demand at the biggest gatherings of medical men in the country.

Under the administration of the present officers, Dr. B. R. Kirklin, president, and Dr. R. L. Beeson, secretary, with the assistance of Dr. Will C. Moore, chairman of the program committee, the Muncie Academy of Medicine has become probably the best known local medical organization in the Middle West.

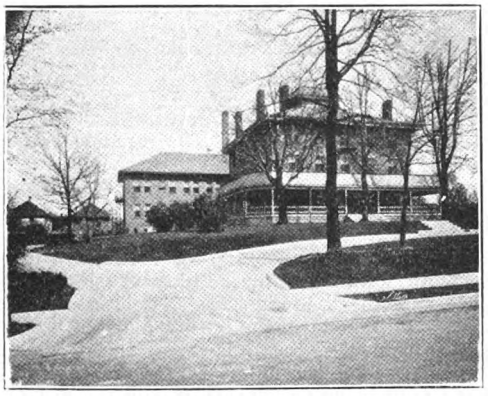
At the present time the Academy meets on three Friday nights each month. The membership is over the 150 mark, but the attendance is often more than 200, and has occasionally approached the 300 mark. It is virtually a sectional organization, as its roster includes the names of the leading physicians and surgeons of Anderson, Marion, Alexandria, Hartford City, Richmond, Newcastle, Dunkirk, Portland, Winchester, Redkey, Ridgeville, Saratoga, Union City, Middletown, Mt. Summit, Selma, Parker, Farmland and Indianapolis. More than fifteen Indianapolis members are active in the Academy. The honorary membership includes noted medical men in Baltimore, Boston, Chicago, Cleveland, Cincinnati, Columbus, O., and at the Mayo Clinic in Rochester, Minnesota.



HOSPITAL FACILITIES

The hospital facilities of Muncie are a little cramped at the present time, as we have only one hospital, which is the Muncie Home Hospital. It is a non-sectarian, non-political institution of fifty beds capacity, and is under the management of a Board of Governors, which is composed of eleven representative business men of the city. In former years there were three hospitals in the city of Muncie, all of them small, private hospitals. In 1914 Dr. G. R. Andrews, one of our local surgeons, built the present Home Hospital and ran it as a private institution until 1917, when it was sold to the present management and has since been run as a public institution.

The hospital is a closed-staff hospital, and is operated under the minimum standards laid down by the American College of Surgeons. The staff is divided into two groups, namely, the general staff, which is composed of all the physicians who are privileged to practice in the



COURT HOUSE

INDIANA STATE NORMAL SCHOOL

hospital, and the executive staff, which is a group of twelve carefully selected physicians of the general staff, who are appointed annually by the Board of Governors. The chief of staff and the secretary of the staff are elected annually by the executive staff and confirmed by the Board of Governors. The executive staff is solely responsible for the professional conduct of the hospital, but has nothing to do with the business of the hospital. Every member of the general staff is compelled to make application for the privilege of practicing in the hospital before he is admitted to the staff. He is then assigned to the service he cares to be assigned to, providing he is found competent to be in this service. His application is approved by the executive staff and the Board of Governors. The hospital operates a training school for nurses which at the present time consists of twenty students. The school for nurses of the

HOME HOSPITAL

Muncie Home Hospital ranks as one of the best among the various training schools of the state.

Adequate pathological, clinical and x-ray laboratory facilities are maintained. The pathological and clinical laboratories are fully equipped to do all types of laboratory work, including basal metabolic work, blood chemistry, etc. The x-ray laboratory is also very fully equipped and they are now installing a 20-inch spark-gap treatment apparatus.

As before stated, the capacity of the hospital is very inadequate. However, the management has been assured during the last few weeks of funds sufficient for an additional 75 or 100 beds and building plans are being rapidly formulated for a new wing which will be a very modern improvement. This gift to the community comes from the Ball Brothers, who have so liberally given to all worthy enterprises in this city, having recently given away one million dollars to be used for community purposes.

HOTELS, TRANSPORTATION FACILITIES, ETC.

With possibly two exceptions, no city in Indiana is more adequately situated as to hotel facilities to entertain the annual session of the

HOTEL ROBERTS

Indiana State Medical Association than is Muncie. In fact, during the past eighteen months this city has attracted so many conventions that it ranks probably next to Indianapolis as a convention host.

Largest and newest of Muncie's hotels is the magnificent Hotel Roberts, which Muncie citizens boast of to all comers and which will be headquarters for the Muncie Session in September. From the amusement parlors and grill room at the bottom to the uppermost of the 270 guest rooms, the Hotel Roberts is absolutely complete. It is also well situated for convention convenience. It is two blocks from the Union Station and two blocks from the Traction Terminal Station. Traction cars from Indianapolis over the Anderson division pass the hotel and those on the Newcastle division stop one block away. The Roberts is directly across the street from the postoffice and from Federal Park, one of the smaller city parks.

The Hotel Delaware is fully as conveniently situated, as it is two blocks from the Traction Terminal Station and all outbound cars on the

Anderson, Fort Wayne, Portland and Union City lines pass it.

The New Kirby Hotel, while close to the center of the business district, is in a somewhat quieter place. One of its chief advantages is that it is only a few yards from the Muncie Chamber of Commerce building.

The Braun Hotel is two blocks from the Chamber of Commerce building and is on the Fort Wayne and Portland traction lines. There are several other smaller hotels in the city which road service to the south and north is offered will provide ample accommodations for the visitors at the Muncie Session.

Visitors to the Muncie Session this fall will find Muncie easily accessible from all directions, both by steam and traction lines. This city is on the St. Louis-Cleveland division of the Big Four, which passes through Terre Haute, Indianapolis, Anderson, Muncie and Union City, in this state. Through service to Cincinnati or Chicago may be had on the C. & O. line. Rail-on the Fort Wayne-Connersville division of the L. E. & W. The Pennsylvania lines branch train from Muncie to Converse connects at the latter station with the main line of the Pennsylvania, from New York to Chicago. Almost hourly service from every direction is offered by the Union Traction Company. Passengers from Indianapolis have similar service on either the Newcastle or Anderson divisions. From Muncie, traction lines radiate to Winchester and Union City to the east; Dunkirk and Portland to the northeast; and Hartford City, Bluffton and Fort Wayne to the north. Direct connection may be had at Anderson with cars for Middletown, Alexandria, Tipton, Elwood, Marion and Wabash.

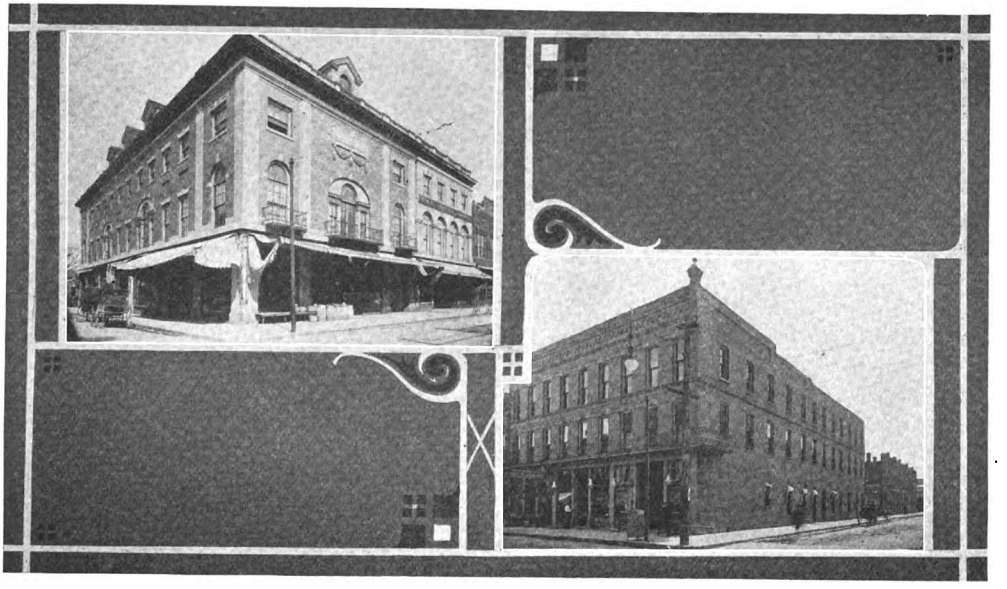
SCHOOLS

The Eastern Division of the Indiana State Normal School, located in the suburb of Normal City, is growing at a rate which promises to make it within a few years one of the largest of the State's educational institutions. The enrollment during the past summer was approximately 1,200, and the winter enrollment this year will be more than 900. The faculty, not including special summer school instructors, includes thirty members. The school here has been a division of the Indiana State Normal School only since 1916. As the Muncie National Institute, it had been in existence for a number of years, but in 1916 the grounds and buildings were purchased by the Ball Brothers of this city and presented to the State. The school is now known locally as Ball Teachers' College, although this is not incorporated in the legal name. Construction work has been started on a new science building and a new gymnasium on the Normal campus. Both of these buildings will be among the best of their character in the State. A new athletic field and running track and several tennis courts will be established near the gymnasium.

Twelve grade school buildings and two high schools comprise the property of the school city of Muncie. The Central High School building is located at the edge of the business district and the Wilson High School is on the south side. While the full state course of study is offered the high school students, emphasis is placed on the commercial and vocational work and the high schools here are among the leaders in the state in these departments. The electrical engineering work, under the direction of Harvey M. Anthony, is undoubtedly of university character and the electrical laboratory is excelled in no high schools and in few colleges and universities in the country. The woodworking, machine, printing and drafting shops are also models of excellence.

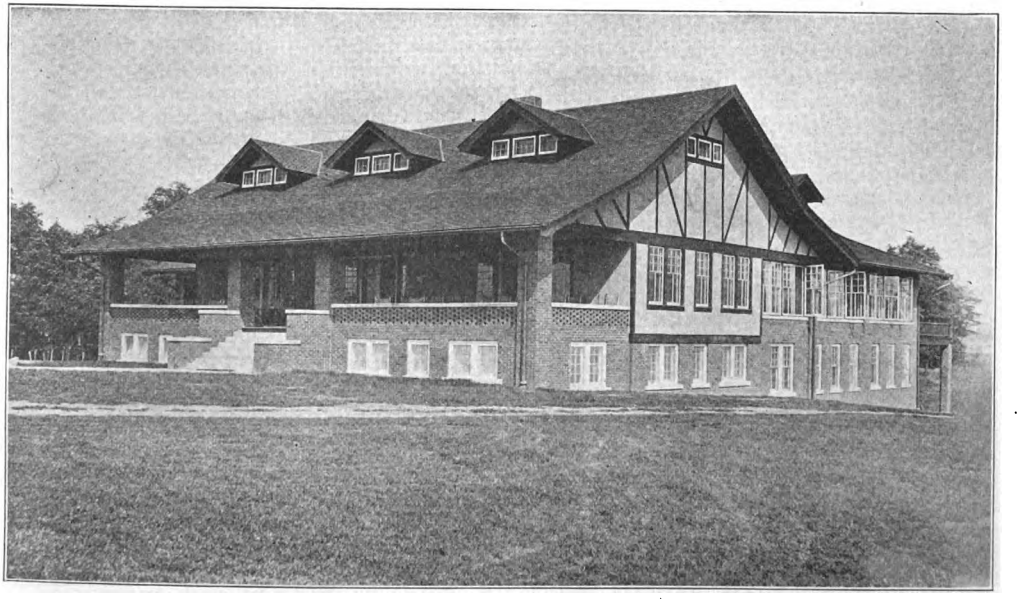
One new grade school building is now under construction to replace the Emerson School, which had become inadequate. The eleven other grade buildings are modern and commodious.

During the past year there were 6,900 pupils in all of the city schools, of whom about 1,900 were in the high schools. The teaching corps included 268 instructors and supervisors.



One parochial school, St. Lawrence School, is maintained by the St. Lawrence Catholic parish.

GOLFING



Those visitors to the Muncie Session who have succumbed to the germ, "golfitis incurabilis," will delight in the opportunities afforded by the course of the Delaware Country Club, located about three miles east of the city. A golf tournament on Wednesday afternoon for the medicos is one of the high lights of the convention program. The Country Club course, enlarged from nine to eighteen holes a year ago, is one of the sportiest and most complete eighteen-hole courses in the state. It was designed and the construction was supervised by Arthur Lockwood of French Lick, who built the famous French Lick courses. Another attraction, and one to which Muncie has exclusive privilege, is the open state golf champion. Jack Blakeslee, the Delaware Country Club pro, won the state open title at Indianapolis last year, achieving the phenomenal record of finishing sixteen strokes above the runner-up. Blakeslee was also the only Hoosier who qualified in the national open tourney at the Skokie course, Glencoe, Ill., in July. The club house also will be at the disposal of the guests during the tournament.

FACTORIES

Statistics from a survey taken in 1920 show that Muncie then had 53 factories, with a total of 13,540 employes, a combined weekly payroll of approximately $356,028.75, and a factory

CHAMBER OF COMMERCE CENTRAL INDIANA GAS CO.

DELAWARE COUNTRY CLUB

production value in 1919 of $100,000,000. Among the larger manufactories are Ball Brothers' Glass Manufacturing Co., the largest glass fruit jar company in the world; the Muncie Products Co., a unit of the General Motors Corporation, steering devices and transmissions; Warner Gear Company, transmissions, differentials and clutches; Durant Motor Company, manufacturers of the "Durant Six" automobile; Warner Corporation, auto parts; Muncie Foundry and Machine Company, motor castings; Ontario Silver Company, silverware; Broderick Boiler Works; Gill Clay Pot Company; Glascock Manufacturing Company, auto bodies; Hemingray Glass Company, glass insulators; Hinde Dauch Paper Company; Indiana Bridge Company; Indiana Steel and Wire Company, and Republic Iron and Steel Company.

PARKS

Muncie's four parks, two of which are large, embrace an area of 165 acres. McCulloch Park, the city's particular pride, is one of the best known and most beautiful parks in the state. A large shelter house, equipment for sports, and a small zoo are features of McCulloch Park. Heekin Park, in the southeastern part of the city, does not have the natural advantages of McCulloch Park, but is, nevertheless, a real beauty spot. Since early in the season motor tourists have been flocking to the new tourists' camping site established in Heekin Park. Many camping conveniences are provided. Rose Park, located in the southwestern section, is essentially a playground, and Federal Park, in the business district, is a place of rest and coolness for the pavement-weary and the heat sufferer.

Y. M. C. A. AND Y. W. C. A.

The Y. M. C. A. and Y. W. C. A. are civic centers. The Y. M. especially, because of its adequate accommodations, is headquarters for many educational, religious and athletic activities. While the Muncie "Y" is outstanding among the associations of the state, the boys' department has received particular renown, especially in Bible study work. For the past six years, the boys' department has led the entire United States in the number of national association Bible study diplomas received. Camp Crosley, the Y. M. C. A.'s summer camp at Lake Tippecanoe, is one of the finest boys' camps in the country and it is being taken for a model by many associations.

CLUBS AND LODGES

Visiting physicians who are members of any of the national or international civic clubs will find a "club welcome" in Muncie, for this city is represented by most of the prominent clubs. The Exchange, Rotary and Optimist Clubs meet each Thursday noon at luncheon, the Kiwanis Club on Wednesday noon, the Lions and Ad Clubs on Tuesday noon. An effort is being made to have a joint meeting of all of these clubs on the Thursday noon of the week of the Muncie Session, at which Dr. W. A. Evans, of Chicago, a session speaker, will likely talk.

Muncie is a strong fraternal city and members of almost all fraternal orders will find a hearty welcome here. The Muncie Aerie of Eagles has a splendid home and the Elks' Lodge is just completing a large and exceptionally fine home. A Masonic Temple, which will be one of the best in this section, is in course of construction. Brother Masons, Elks, Moose, Eagles, etc., will be on every hand to welcome the "pill-dispensers" and knife and saw wielders, when they come to Muncie in September.

NEWSPAPERS

Muncie's two daily newspapers, The Muncie Star, a morning paper which is a member of The Star League of Indiana, and the Muncie Evening Press, will carry full session reports each day. The Star, which has a daily circulation of 23,000 and a Sunday circulation of 16,000, is the largest daily in eastern Indiana, and it covers the entire Eighth district. It is served by the Associated Press. The Muncie Evening Press has a circulation of about 9,000. It carries the I. N. S. telegraphic reports.

CHAMBER OF COMMERCE

The Chamber of Commerce building is one of the principal convention centers of Muncie. The chamber is one of the largest in Indiana, having a membership of about 800, but its principal claim to distinction is in its home building, which is second in size and value to that of the Indianapolis chamber, but which is generally agreed to be the best equipped and most serviceable for Chamber of Commerce purposes in the state. The Chamber's assembly hall, which will seat about 600 persons, is utilized by many conventions.

CHURCHES

Muncie is quite a church city, having thirty-eight churches, representing all prominent denominations. Three churches, the High Street M. E., the First Presbyterian and the First Baptist, are virtually in the business district of the city, and of the other large ones, the Friends Memorial, Jackson Street Christian and St. Lawrence Catholic are within a few blocks of the business district.

The Muncie Public Library, which is Carnegie endowed, has 42,374 books in circulation. In July there were 18,278 borrowers listed and books were taken out 111,786 times. The library building is at the edge of the business district of the city.

The city is protected from fire by a force of thirty-five firemen, located at three stations. The buildings and grounds of the department are valued at $60,000 and the equipment at $30,000. The police department has twenty-seven members, who work under the two-platoon system.

Other statistics of interest regarding Muncie include the following: Population, 36,524; miles of streets, 138.42; area, 7.15 square miles; miles of pavement, 90.61; miles of gas mains, 100; miles of public sewers, 43.05; assessed valuation of city property, $58,188,780; miles of city car lines, 14.5.

PLACES AND TIME OF MEETINGS

The Hotel Roberts has been selected as the general headquarters of the Association and here the registration desk will be located. The first meeting of the session will be that of the Council which will be held in the grill room of the Hotel Roberts at 4:30 p. m. on Wednesday. In the evening of the same day the House of Delegates will meet in the grill room of the Hotel Roberts at seven o'clock, and following this, at eight o'clock will be the informal smoker in the ball room of the Hotel Roberts. The evening of the first day the ladies will be entertained with a theater party at the Wysor Grand Theater. The golf tournament will be held on Wednesday afternoon at the Delaware Country Club. On Thursday morning the general meeting will be held in the high school auditorium, and in the afternoon the Section on Surgery will meet at the high school auditorium, while the Section on Medicine and the Section on Ophthalmology and Otolaryngology will meet at the Hotel Roberts. In the evening the Garrett Boys' Band of Muncie will give a concert at the Hotel Roberts from 6:30 until 7:30, and at eight o'clock a public meeting will be held at the high school auditorium with Dr. W. A. Evans, of Chicago, the speaker. Following this there will be dancing at the Hotel Roberts. On Friday the House of Delegates will meet at the Chamber of Commerce at 8 a. m., and the various sections will hold meetings at 9 a. m. The general meeting will be held at the high school auditorium on Friday afternoon at 2 p. m. The Council will meet in the Hotel Roberts at the same hour.

REGISTRATION

It is important that immediately upon arriving in Muncie the members of the Association should proceed at once to the registration bureau at the Hotel Roberts and register. Registration will be by membership card, and to avoid delay and confusion members are urged to have their cards ready for inspection by the Registration Committee. Registering members are requested to indicate the number of ladies in the party so that the Committee on Entertainment may know early the number to be provided for. Badges will be furnished to the members for identification. Letters and telegrams may be sent to the Hotel Roberts in charge of the Committee on Registration.

HOTELS

The Hotel Roberts is the headquarters of the Association. Rates at this hotel are as follows: Rooms, with shower, accommodating two people, $4.00; room, with bathtub, accommodating two people, $5.00 and $6.00; for each additional person in room, $2.00. Hotel Delaware: Single room, with bath, $2.50; double room, with bath, $3.50; single room without bath, $1.50 to $1.75; double room without bath, $2.50 to $2.75. Hotel Kirby: Single rooms, $1.25, $1.50 and $2.00. There are several smaller hotels which have very good accommodations. If you are unable to secure satisfactory accommodations at any of the above hotels, immediately get in touch with Dr. Earl S. Green of Muncie, who has charge of the reservations, and the Committee on Arrangements will see that suitable accommodations are arranged, either in one of the smaller hotels or in homes.

OFFICIAL CALL TO THE HOUSE OF DELEGATES

The next annual session of the Indiana State Medical Association will be held at Muncie, Wednesday, Thursday and Friday, September 27, 28 and 29, 1922.

The House of Delegates will be constituted as follows: Marion County, 8 delegates; Allen County, 2 delegates; Lake County, 2 delegates; St. Joseph County, 2 delegates; Vanderburg County, 2 delegates; Vigo County, 2 delegates; the other seventy-eight counties each one delegate (two more paid-up members will entitle Delaware-Blackford County to one more delegate); thirteen councilors; the ex-presidents, namely, G. F. Beasley, C. S. Bond, M. F. Porter, W. N. Wishard, J. C. Sexton, G. W. McCaskey, A. W. Brayton, J. B. Berteling, G. T. McCoy, D. C. Payton, T. C. Kennedy, W. F. Howat, J. P. Salb, G. F. Keiper, J. H. Oliver, J. R. Eastman, W. H. Stemm, C. H. McCully, David Ross; in addition to this, the President and Secretary of the Association, and the Editor of THE JOURNAL, all without power to vote except in case of a tie, when the President shall cast the deciding vote.

Blank credentials have been sent by the Secretary to each county society, and the properly executed credentials for the delegates should be mailed immediately to Dr. Charles N. Combs, Terre Haute, or brought to the session. No delegate will be seated unless wearing the official badge.

The House of Delegates will convene promptly at 7 p. m. Wednesday, September 27th, in the Grill Room, Roberts Hotel, and again at 8 a. m. Friday, at a meeting place to be designated later.

The order of business will be as follows:

1. Call to order by the President.
2. Roll call and seating of qualified delegates.
3. Reading of the minutes of previous meeting.
4. Report of the Secretary-Treasurer.
5. Reports of standing committees:
   a. Administration and Medical Defense.
   b. Publication.
   c. Public Policy and Legislation.
   d. Medical Education.
   e. Hospital Standardization.
   f. Automobile Insurance.
   g. Scientific Work.
   h. Necrology.
   i. Arrangements.
6. Reading of Communications.
7. Reading of Memorials and Resolutions.
8. Unfinished business.
9. New business.
10. Adjournment.

The election of officers will be the first order of business Friday at 8 a. m. In addition to the regular officers, the terms of the following expire January 1, 1923, and their successors must be elected at this session: Delegates to the American Medical Association to succeed J. R. Eastman, Indianapolis; alternate, M. R. Combs, Terre Haute, to be elected for the ensuing two years. Delegates must have been members in good standing of this Association and of the American Medical Association for the past two years. Since the next meeting will be in San Francisco, no one should be elected who is not willing to make this trip and represent the Association. Member of the Committee on Administration and Medical Defense to succeed George R. Daniels, Marion, for the ensuing three years; also successor to the late Dr. Frank B. Wynn, Indianapolis, whose term would have expired Dec. 31, 1923. Member of the Committee on Hospital Standardization to succeed E. J. Lent, South Bend, for the ensuing five years. Delegates from counties comprising the third, sixth, ninth and twelfth districts are reminded that the terms of their councilors will expire on December 31, 1922, and new councilors should be elected to succeed the following:

Third District, Walter J. Leach, New Albany.

Sixth District, Frank J. Spilman, Connersville.

Ninth District, William R. Moffitt, Lafayette.

Twelfth District, W. D. Calvin, Fort Wayne.

It is very probable that some of these elections already have been held, but they should be reported to the House of Delegates at this session for confirmation.

CHARLES N. COMBS, Secretary.

ANNOUNCEMENTS

Following the address of Dr. W. A. Evans, on Thursday evening, there will be dancing in the ball room of the Hotel Roberts for all those who care to indulge.

Arrangements for class dinners or luncheons should be made promptly through the chairman of the Committee on Arrangements. Due care should be observed not to have any social functions interfere with the scientific meetings.

The Muncie Exchange, Rotary and Optimist Clubs meet each Thursday noon at luncheon, and the Kiwanis Club each noon on Wednesday. Members of these clubs in other cities are invited to be the guests of the Muncie clubs at the regular luncheon.

Essayists are reminded that all papers presented before the Association become the property of the Association, and, therefore, are not to be published or submitted for publication elsewhere than in THE JOURNAL of the Indiana State Medical Association.

The Garrett Boys' Band, Muncie's musical organization which has gained more than state-wide fame, will give a concert at the Hotel Roberts from 6:30 until 7:30, Thursday evening, and later, following the public meeting in the high school auditorium, there will be a dance in the ball room of the Hotel Roberts.

The members and those accompanying them are requested to register on their arrival. The bureau of information and registration is in the lobby of the Roberts Hotel. Present your membership cards when registering. Members without their cards may register after their standing has been verified by consulting the records.

The election of officers will be the first order of business at the meeting of the House of Delegates held at the Chamber of Commerce, Friday, September 29, at eight o'clock. No member of the House of Delegates is eligible to office, and delegates to the American Medical Association must have been members in good standing of the A. M. A. for the past two years.

You are requested to wear the official badge which is supplied when you register when attending or participating in the meetings. Members of the House of Delegates will have designating badges. Only those who are accredited delegates are entitled to vote at the meetings of the House of Delegates, or even to address the House of Delegates without special permission.

Register early. The booth for registration will be open Wednesday afternoon at one o'clock, and be open throughout the session. Please have your pocket cards with you in order to avoid delay in registration. If you have paid your dues to your county society secretary *only recently*, and have not yet received your membership card, present a receipt from the county secretary and you will be permitted to register. Please get your badge and wear it.

A luncheon for all officers of the Medical Reserve Corps residing in Indiana has been arranged for noon Thursday, September twenty-eighth, at the Grill Room, Roberts Hotel, Muncie. Lt. Col. A. W. Williams, M.C., U. S. A., will be present. Immediately following the luncheon there will be an informal meeting of the Medical Officers attached to the 84th Division, at which time plans for perfecting the organization will be discussed.

Not in many years have ladies been offered so much entertainment as has been provided for those who will attend the Muncie Session. Therefore, do not hesitate to bring your wife or sweetheart in the mistaken notion that she will have a stupid time. The committee in charge of the entertainment for the ladies throughout the session is composed of Mrs. I. M. Trent, Mrs. L. L. Ball, Mrs. E. S. Green, Mrs. U. G. Poland, Mrs. C. E. Miller, Mrs. C. M. Mix and Mrs. S. G. Jump.

Essayists should bear in mind that their papers as presented at the Muncie Session represent copy for THE JOURNAL, and accordingly the title and full name and address of the essayist should appear at the top of the manuscript, and the body of the manuscript should be carefully edited. Attention to the paragraphing, punctuation, capitalization and grammatical construction of sentences will go a long way toward helping the editor and printers. All manuscripts should be typewritten.

The ladies especially are invited to attend the Muncie Session. They will be entertained by a theater party on Wednesday evening; with a luncheon at the Country Club on Thursday noon, followed by a musical in the afternoon; and, on Friday, by an automobile ride, and luncheon at the country home of Dr. and Mrs. C. M. Mix. Those ladies who expect to attend the luncheons should make known the fact to the chairman of the Committee on Arrangements so that appropriate arrangements may be made.

Golfers are invited to go to Muncie early in order to enjoy the hospitality of the Delaware Country Club, which offers a new eighteen-hole course said to be one of the best in the Middle West. On Wednesday morning an opportunity will be offered of settling old scores with golfing friends, and in the afternoon there will be a tournament. Those intending to take advantage of the golfing privileges are requested to write Dr. Frank G. Jackson, 214 East Adams Street, Muncie, or to Dr. C. A. Leatherman, care General Motors Corporation, Muncie.

CONDENSED PROGRAM

Wednesday, September 27

AFTERNOON

Meeting of the Council, at 4:30 p. m., Grill Room, Roberts Hotel.

EVENING

Meeting of House of Delegates, 7 o'clock, Grill Room, Roberts Hotel.

Informal Smoker and get-together meeting, 8 o'clock, Ball Room, Roberts Hotel.

Thursday, September 28

FORENOON

General Meeting, 8:30 a. m., High School Auditorium.

No section meetings.

AFTERNOON

Meeting of Section on Surgery, 2 p. m., High School Auditorium.

Meeting of Section on Medicine, 2 p. m., Ball Room, Roberts Hotel.

Meeting of Section on Ophthalmology and Otolaryngology, 2 p. m., Grill Room, Roberts Hotel.

EVENING

Public Meeting, 8 p. m., High School Auditorium. Musical program and address by Dr. W. A. Evans, of Chicago. Subject, "Sickness in Winter Time."

Friday, September 29

FORENOON

Meeting of House of Delegates at 8 a. m., Chamber of Commerce.

Meeting of Section on Surgery, 9 a. m., High School Auditorium. Election of Section officers.

Meeting of Section on Medicine, 9 a. m., Ball Room, Roberts Hotel. Election of Section officers.

Meeting of Section on Ophthalmology and Otolaryngology, 9 a. m., Grill Room, Roberts Hotel. Election of Section officers.

AFTERNOON

Meeting of Council, 2 p. m., Grill Room, Roberts Hotel.

General meeting, 2 p. m., High School Auditorium.

OFFICIAL PROGRAM OF THE ANNUAL SESSION OF THE INDIANA STATE MEDICAL ASSOCIATION

TO BE HELD AT MUNCIE,

SEPTEMBER 27, 28, 29, 1922.

HOUSE OF DELEGATES

First meeting, Grill Room, Roberts Hotel, Wednesday evening, September 27, at 7 o'clock.

Second meeting, Chamber of Commerce, Friday morning, September 29, at 8 o'clock.

COUNCIL

First meeting, Grill Room, Roberts Hotel, Wednesday afternoon, September 27, at 4:30 o'clock.

Second meeting, Grill Room, Roberts Hotel, Friday afternoon, September 29, at 2 o'clock.

Additional meetings at the call of the President of the Council.

GENERAL MEETINGS

(HIGH SCHOOL AUDITORIUM)

Thursday, September 28, 8:30 a. m.
Friday, September 29, 2 p. m.

PUBLIC MEETING

(HIGH SCHOOL AUDITORIUM)

Thursday, September 28, 8 p. m.

SECTION ON SURGERY

(HIGH SCHOOL AUDITORIUM)

Thursday, September 28, 2 p. m.
Friday, September 29, 9 a. m.

SECTION ON MEDICINE

(BALL ROOM, ROBERTS HOTEL)

Thursday, September 28, 2 p. m.
Friday, September 29, 9 a. m.

SECTION ON OPHTHALMOLOGY AND OTOLARYNGOLOGY

(GRILL ROOM, ROBERTS HOTEL)

Thursday, September 28, 2 p. m.
Friday, September 29, 9 a. m.

COMMERCIAL EXHIBITS

(HOTEL ROBERTS)

Wednesday noon to Friday night.

REGISTRATION

(LOBBY—HOTEL ROBERTS)

Wednesday afternoon.
Thursday and Friday.

ENTERTAINMENT

Wednesday, September 27, 8 p. m., smoker and get-together meeting Ball Room, Roberts Hotel.

Wednesday morning, September 27, open golf; and in afternoon golf tournament, Delaware Country Club.

Wednesday evening, September 27, moving pictures and vaudeville at the Wysor Grand Theatre for the ladies.

Thursday, September 28, 12 m., luncheon for all officers of the Medical Reserve Corps residing in Indiana, Grill Room, Roberts Hotel. Lt. Col. A. W. Williams, M.C., U. S. A., speaker.

Thursday, September 28, following public meeting, dancing, Roberts Hotel.

Thursday noon, September 28, luncheon for the ladies at the Delaware Country Club, followed by a musical in the afternoon.

Friday, September 29, 10 a. m., automobile ride for the ladies, visiting Ball Brothers Fruit Jar Company, General Motors Corporation, parks, Indiana State Normal School, Durant Motors, etc. Twelve to 1:00 p. m., luncheon at "Wild Banks" Farm, the country home of Dr. and Mrs. C. M. Mix.

SCIENTIFIC PROGRAM

GENERAL MEETINGS

(HIGH SCHOOL AUDITORIUM)

Thursday, 8:30 A. M.

Organization.

Address of Welcome.

Address of President, "The Status of the Profession in Indiana", William R. Davidson, Evansville.

SYMPOSIUM: ENDOCRINOLOGY.

1. GEORGE W. MCCASKEY, Fort Wayne.

Subject: The Medical Phase of Endocrinology.

Abstract.—Outline of principles of endocrinology. Organs concerned. Active bio-chemical bodies produced and a summary of their physiological and pathological effects. Type of cases in which a clinical study of endocrine function is most valuable. A few cases illustrating the diagnostic value of these methods. Summary of the present status of endocrinology. The various diseases in which perversions of endocrine function play a dominant or at least an important role.

Discussants: Edgar F. Kiser, Indianapolis; L. P. Drayer, Fort Wayne.

2. C. C. BITLER, Newcastle.

Subject: The Neurological Phase of Endocrinology.

Abstract.—The ductless glands in their relation to the sympathetic nervous system and the consequent effect of their secretions upon the vegetative nervous system and resulting nervous manifestations on the individual. The products of the glands are discussed individually and collectively. The nervous symptoms following infectious diseases are partly explained by the unbalancing effect of the toxins of the infections upon endocrine glands.

After a careful review of the literature and personal interviews with authorities and my own limited observations on the subject the conclusion is reached that the glands of internal secretion probably have a greater effect upon personality both normal and abnormal than we have ever supposed, and that the field for scientific investigation is unlimited, as the most we have is theories and treatment almost entirely empirical.

Discussants: Albert E. Sterne, Indianapolis; Charles P. Emerson, Indianapolis.

3. W. D. GATCH, Indianapolis.

Subject: The Surgical Phase of Endocrinology.

(*No abstract.*)

Discussants: Tom Jones, Anderson; H. H. Martin, Laporte.

Friday, 2 P. M.

SYMPOSIUM: MENINGITIS.

1. CHARLES F. NEU, Indianapolis.

Subject: Meningitis, Differential Diagnosis.

Abstract.—The diagnosis of meningitis primarily is determined by the consideration—

(1) of symptoms depending upon disease processes taking place on the surface of the brain and their manner of development.

(2) of general symptoms due to systemic involvement by the infection or its toxins.

(3) of the history of its probable cause.

(4) of changes to be found in the character and composition of the cerebro-spinal fluid.

Various systemic diseases as well as focal lesions of the central nervous system may be accompanied by symptoms very similar in type and character to those met with in the various forms of meningitis. Typhoid fever, pneumonia, uremia, delirious states resulting from toxins arising within the body or introduced into it from without, vascular lesions, brain tumors, acute-psycho-neurotic states and many other conditions at times develop a symptomatology closely resembling that of meningitis.

In many of these conditions the diagnosis is rendered more difficult because of the fact that meningitis may arise as a complication of the primary disease.

The information to be gathered from examination of the cerebro-spinal fluid is in most cases the most reliable means of making a definite diagnosis. But even this at times may lead one astray because in the early stages of some forms of meningitis, particularly when secondary to some focal infection, one may find very little change in the character or composition of the cerebro-spinal fluid.

Since lumbar puncture, if properly carried out, rarely does any harm, and is practically devoid of any danger, this procedure is justified in every case of doubt presenting suspicious symptomatology.

2. MILES F. PORTER, JR., Fort Wayne.

Subject: Meningitis, Treatment.

Abstract.—The treatment of meningitis depends naturally upon the etiological factor. In the more common form (that produced by the meningococcus) treatment means Flexner's serum. Attempt should be made to get all the serum necessary to produce desired effect, introduced within thirty-six hours of onset or at least diagnosis. In preparation large quantities of spinal fluid should be withdrawn, both to avoid risk of administration of serum and for therapeutic effect. Intravenous use of serum in conjunction with intraspinous highly advisable. Large doses of serum not harmful but prolonged use of it may be productive of continued fever and neurological symptoms. Recrudescence should be rare.

Meningitis from other causes not rare—and not hopeless—original focus of infection should be removed or drained and biological therapy attempted. Frequent drainage of fluid helpful. Authentic cure not rare—illustrative cases.

3. HARRY BOYD-SNEE, South Bend.

Subject: Otitic Meningitis.

Abstract.—The paper discusses suppurative meningitis of otitic origin and deals particularly with the etiological factors which are operative in determining that complication as it has been observed to develop in connection with insults to the integrity of the temporal bone.

Discussants: Robert M. Moore, Indianapolis; D. O. Kearby, Indianapolis; Earl O. Daniels, Marion; George V. Cring, Portland.

SECTION ON MEDICINE

(BALL ROOM, ROBERTS HOTEL)

Thursday, 2 P. M.

1. JOHN H. WARVEL, Indianapolis.

Subject: Some Observations on Cases Showing a Disturbance of Carbohydrate Metabolism.

Abstract.—1. The usual carbohydrate intolerance as noted in the diabetic patient.

2. The faulty carbohydrate metabolism noted in the thyroid, pituitary and other endocrine disturbances.

3. The appearance of hyperglycemia before the presence of glycosuria; in patients who later develop true diabetes.

Point number three will be the one on which I wish to place the most emphasis.

Discussants: B. M. Edlavitch, Fort Wayne; C. R. Strickland, Indianapolis.

2. O. G. PFAFF, Indianapolis.

Subject: Congenital Pyloric Stenosis.

Abstract.—Congenital pyloric stenosis occurs with considerable frequency. Many cases not diagnosed inevitably go on to fatal termination. Recent surgical intervention shows almost uniformly ideal results. The diagnosis is easy and the operation both simple and safe, and should generally be performed under novocaine anesthesia.

Discussants: James C. Carter, Indianapolis; W. D. Gatch, Indianapolis.

3. ALFRED HENRY, Indianapolis.

Subject: The Treatment of Pulmonary Tuberculosis.

Abstract.—The treatment for pulmonary tuberculosis is what it has always been, *i. e.*, bed rest, fresh air, nourishing food, peace of mind, and medical attention. The greatest of these is bed rest. The medical profession is making strides in helping people with this disease get well by insisting on more effort on the part of the patient.

Tuberculin therapy is used in some cases but seems to be overworked. The idea is not to condemn tuberculin therapy but to advise more precaution in the selection of suitable cases for its use. The typical case is one running no temperature and getting nowhere in the cure process. He might be called the semi-invalid.

The greatest help that has come to the medical profession in the treatment of advanced pulmonary tuberculosis is artificial pneumothorax. This consists of partially or completely collapsing the involved lung. This method forces rest, which is the greatest curative agent in the tuberculosis field.

Graduated exercise is just as necessary in the convalescing stage as rest is in the active stage in the cure-taking process.

Discussants: Gardner C. Johnson, Evansville; Charles R. Bird, Greensburg.

4. J. E. LUZADDER, Bloomington.

Subject: The Therapy of Syphilis.

Abstract.—Syphilis is responsible for one-third of pathology, is the chief factor in organic diseases of the nervous system, and is responsible for 12 percent of the 200,000 cases of insanity in the United States. Ten percent of the male population of the United States are infected, 10 percent of dermatoses are specific.

The most valuable of laboratory methods are the testing of blood for complement fixation, examination of spinal fluid and demonstration of the spirochetes in the lesions.

In treating syphilis a risk accompanies the conjoined administration of neoarsphenamine and mercury. For intensive treatment these drugs should be given separately.

The drug intrimine should be given in doses of 3 cc. intramuscularly. This drug is a sulphur product—a reducing agent—which prevents arsenic and mercury from exercising a toxic effect on nerve tissue.

In neuro-syphilis the intraspinal treatments are given as the intravenous administration has not proven satisfactory.

In conclusion neosalvarsan therapy is necessary since it controls infectivity and contagion. It yields quick results. Mercury is essential as an aid to a permanent cure. Overtreatment is preferred to lack of treatment. Mercury given not by the month but by the year, and neoarsphenamine not by the dose but by the half-dozen of doses, must be given before any hope of a cure can be effected.

Discussants: C. L. Bock, Muncie; Frank G. McCarthy, Terre Haute.

Friday, 9 A. M.

1. JAMES WYNN, Indianapolis.

Subject: Sensitivity to Epidermal and Pollen Proteins; Diagnosis and Treatment.

Abstract.—The various clinical pictures of sensitiveness to pollens and epidermal proteins have long been recognized, as evidenced by the work of Bostock, Blackley, Curtis, Dunbar, etc. To Meltzer belongs the credit of pointing out that certain types of asthma and paroxysmal rhinorrhea are anaphylactic phenomena. It remained for Walker to put the treatment of both asthma and hay fever of protein origin on a sound practical basis.

The state of sensitiveness to any protein means the presence of fixed cellular antibodies; on the other hand, the state of immunity for a particular antigen means the presence of circulating antibodies for that specific antigen.

A state of sensitiveness may manifest itself by any one or more of several symptoms, sneezing attacks and lacrimation, asthmatic seizures, cutaneous manifestations, etc. Each syndrome has rather distinctive features. Analysis of certain facts in the history will often suggest the offending protein. To clinch the etiological diagnosis fixed cellular antibodies to the suspected protein should be demonstrated by the skin test.

The ideal treatment of these conditions is of course the removal of the cause—the withdrawal of patient from protein (as in the vacation treatment of hay fever) or protein from patient (as in the feather and hair cases). In many instances this is impractical, and the patient must be desensitized. This is accomplished by a course of injections with the specific antigen. (Preparation of the antigen and its administration are fully discussed.)

Though the specific treatment of these protein cases is at present hardly within the realm of the general practitioner, he should be familiar enough with clinical features to recognize and classify these cases with considerable accuracy as they occur in his practice. The more complete differential diagnosis and desensitization must be left to those especially equipped for this work.

Discussants: C. G. Beall, Fort Wayne; William D. Asbury, Terre Haute.

2. S. C. WATERS, Middletown.

Subject: Epidemic Jaundice.

Abstract.—Differentiation of various forms of jaundice. Criticism of assumption that the leptospiro icterohemorrhaica is the cause. Extent and prevalance. Influenzal character of epidemic. History, seasonal and age incidence. Summary of symptomatology of forty cases clinically observed. Treatment and conclusions.

Discussants: W. M. Stout, Newcastle; Will P. Shimer, Indianapolis.

3. DR. CHARLES LOUIS MIX, Chicago.

Medical Address.

4. W. A. FANKBONER, Marion.

Subject: Sequellæ of Lethargic Encephalitis.

Abstract.—Epidemic Encephalitis—Some After Effects: 1. Anatomical considerations. 2. Personality before and after. 3. Report on cases mentioned in paper presented at last meeting.

Discussants: Wier Miley, Anderson; C. A. Sellers, Hartford City.

SECTION ON SURGERY

(HIGH SCHOOL AUDITORIUM)

Thursday, 2 P. M.

1. CHARLES H. FRAZIER, Philadelphia.

Surgical Address, "The Trend of Neurological Surgery."

2. J. RILUS EASTMAN, Indianapolis.

Subject: A Safe Method for Drainage of Intra-Abdominal Abscesses.

Abstract.—Employment of extra peritoneal drainage tube for retro-cecal abscesses; use of large cigarette drain for trans-abdominal drainage of pelvic abscess without puncture of abscess at the time of opening of the abdomen, dependence being placed upon the pressure of the drain, suction and chemotaxis to induce rupture of the abscess after a walled off canal has been formed; other applications of this principle.

Discussants: Miles F. Porter, Sr., Fort Wayne; Wm. J. Moore, Muncie.

3. A. P. ROOPE, Columbus.

Subject: Thyroid Disease.

Abstract.—Goitre is an extremely prevalent disease and is much neglected in its early and inactive states.

Early and borderline cases of hyperthyroidism often present great difficulties of diagnosis. Not all cases are surgical. X-ray has its place in treatment. The nose, throat and mouth should have careful attention in every case.

Treatment of goitre of the adolescent is usually mental, moral and physical hygiene. Sooner or later adenomatous goitre is practically always toxic. The length of time goitre has existed and its size bear no relation to the violence of symptoms. Young children with enlarged thyroids should always receive medical care. Prevention is a duty this generation owes to the next.

Discussants: J. Y. Welborn, Evansville; F. H. Jett, Terre Haute.

4. FRANK W. FOXWORTHY, Indianapolis.

Subject: Diagnosis of Duodenal Ulcer.

Abstract.—Operative surgery and autopsies have shown a large percentage of undiagnosed duodenal ulcers. On account of the hordes of chiropractors and other irregulars endeavoring to cause dissension among the members of the regular medical fraternity, any procedure that promotes harmony between the internists and surgeons is to be desired. As the surgeons and internists at the joint section meeting at the St. Louis session of the American Medical Association agreed on a rational method of the treatment of duodenal ulcer, is it not possible for them to agree on a standard method of diagnosis? Such a method, with a new scheme for examination, is offered for consideration.

Discussants: W. H. Foreman, Indianapolis; H. O. Bruggemann, Fort Wayne.

5. F. C. WALKER, Indianapolis.

Subject: Reconstruction of Perineal Genito-Urinary Childbirth Injuries.

Abstract.—The anatomy and functions of the perineal parts and the closely associated genito-urinary structures have not been as clearly visualized, both in the normal and the abnormal, as they should be to act as a basis for reconstruction. This has led to errors in prevention, diagnosis and treatment. Pelvic supporting structures best understood when considered in three strata. It is pretty generally understood now that some of the standard former operations for perineal repair were merely vaginal resections and failed to get the supporting tissues.

Associated secondary lesions as misplacements, decensus, cystocele and rectocele are very common. Cystocele and rectocele are true herniæ. Any reconstruction surgical procedure must take into consideration any and all of these conditions and their various combinations. A great many such results could be prevented by better obstetrics. Age; number of children; concurrent disease in other organs; character and degree of the local secondary resulting derangement and the social conditions must be carefully appraised in outlining treatment.

Hysterectomy is advisable in women near or past the menopause, or in younger women with a distinct uterine or cervical disease, followed by complete adjustment of the remaining structures. The primary object is to cure the patient of the cause of her suffering and annoyance. Too many return complaining of no relief or incomplete relief because all factors have not been duly considered. Vaginal or abdominal route may be elected, depending on indications and conditions. If hysterectomy not best, some reliable form of suspension should be used. The bladder in any method should be dissected from its cervical and vaginal attachments and anchored high by using the perivesical fascia and a well supported vaginal stump.

Deep perineal recto-vaginal septum dissection is very essential. Rectum should be pushed upward and backward and fixed with a vaginal suture. The levator muscle and fascia must be exposed and securely united as these are the real supporting structures. Method of deep suture insertion simplifies operative technic. Smallest amount of foreign material should be used as is consistent with good co-aptation without constriction.

No small part of the success of the operation depends upon the post-operative care of a good nurse. This work depends for results on the minutest care to detail. Lack of this may defeat the purpose of a well executed operation.

Discussants: A. A. Rang, Washington; J. H. Weinstein, Terre Haute.

6. E. E. PADGETT, Indianapolis.

Subject: Tuberculosis of the Female Generative Organs.

Abstract.—This disease is by no means rare. In fact it is more common than believed. Often it is overlooked due to the removal of tubes and attributing the condition to some other kind of infection in the absence of further examination.

It is more common in the tubes but may occur in any of the pelvic organs. It may be either primary or secondary to areas of infection elsewhere in the body, most often believed to be the lung. Although it is believed to be more often secondary, often the primary infection is not located. It is a disease of the child-bearing period but no age is exempt.

Its progress is slow in most forms and its symptoms are those of a chronic pelvic inflammation. However, it is accompanied by a temperature in the afternoon which can practically always be found if searched for long enough and which is a vital point in the diagnosis.

Its treatment is operative in practically all cases, and the time and nature of the operation is dependent on the general condition of the patient. (Lantern slides.)

Discussants: Carl Habich, Indianapolis; G. B. Jackson, Indianapolis.

Friday, 9 A. M.

1. A. M. MENDENHALL, Indianapolis.

Subject: Occiput Posterior Positions; Early Diagnosis and Various Methods of Treatment.

Abstract.—Obstetrical reasons why difficult labor. Percentage of occiput posteriors. Early diagnosis important. Diagnosis very often not made even when forceps are being applied. No excuse for applying forceps without a diagnosis as to position. Injuries resulting from occiput posterior delivery.

Treatment:—1. Plenty of time. 2. Postural treatment. 3. Manipulation (explanation in detail). 4. Rotation with hand in vagina. 5. DeLee's treatment. 6. Scanzoni maneuver. 7. Forceps. 8. Version.

Conclusions:—The first three are quite safe. The other methods require considerable experience and skill.

Discussants: Fred Clapp, South Bend; Clay A. Ball, Muncie.

2. H. A. DUEMLING, Fort Wayne.
Subject: Technique of Cholecystectomy.

Abstract.—The course of the cystic artery in relation to the common duct and the gall bladder.

The relation of the cystic duct to the common duct.

Exhibit will be made of a number of clay models and a number of specimens covering the various phases of gall bladder disease.

Discussants: Hugo O. Pantzer, Indianapolis; J. C. Sexton, Rushville.

3. SIMON J. YOUNG, Gary.
Subject: Some Observations on Gall Bladder Surgery.

Abstract.—This paper is designed to bring under discussion some of the problems which confront the surgeon in a case involving operation upon the gall bladder—this in the belief that this field is fertile still for discussion — endeavoring to stimulate thoughtful consideration of those factors of safety and sanity which contribute to better end-results.

First, it deals with the functions of the gall bladder, concerning which there is no little diversity of opinion. Naturally, one's views upon function influence his decision in the choice of an operation, as well as in the treatment of complications. The relationships existing between the gall bladder and other viscera have to be considered, especially with reference to routes of infection, from one to the other. This leads to a discussion of complications and their causes. Pertinent to the subject also are such questions as the necessity for early operation; the indications for and methods of drainage; safety factors in technic; and recurrences after operation. In this, as in other fields of surgery, it is desirable to have a clear conception of inter-related pathology; in no other way may an operation be planned which offers the maximum in service to the patient.

Discussants: E. S. Jones, Hammond; G. G. Eckhart, Marion.

4. G. D. MARSHALL, Kokomo.
Subject: Diseases and Injury to the Hip Joint.

Abstract.—Many of the conditions affecting the hip joint will be mentioned only in connection with differential diagnosis. Special emphasis will be made of the utility of the Bradford abduction splint, in the treatment of both disease and injury of the joint. The need of weight bearing braces in the later treatment of congenital dislocation. Diseases peculiar to the hip joint (Legg-Calve disease, or osteo chondritis deformans juvenalis). Snapping hip joint. Dislocation due to paralysis, poliomyelitis. Fracture of the neck of femur. Traumatic arthritis.

Discussants: C. C. Terry, South Bend; M. S. Davis, Marion.

5. M. A. AUSTIN, Anderson.
Subject: Repair of Three Uncommon Fracture Cases, with the Use of an Original Crucifixion Splint in Fracture of the Surgical Neck of the Humerus.

Abstract—A report of three recent fracture cases with unusually difficult problems to meet. (1) A multiple fracture case of left hip, left leg, left forearm and right wrist. Perfect result in forearm and leg, good functional result in hip and requiring removal of right carpal scaphoid. (2) Fracture of upper third of hip, in which ordinary methods of immobilization failed and five reductions were required, and perfect result obtained after open operation and immobilization in an unusual manner. (3) Fracture of the surgical neck of the humerus of the type which Scudder states is impossible to immobilize and retain without open operation. Perfect result obtained by the use of an original "Crucifixion" type of extension splint.

Discussants: J. E. Hiatt, Richmond; E. H. Clauser, Muncie.

6. H. R. ALLEN, Indianapolis.
Subject: The Surgical Engineer.

Abstract.—There now exists an organization of surgical engineers with headquarters and laboratories and a firm determination to investigate physical principles and devices and uses of energy employed in different branches of surgery. On its consulting staff are the ablest mechanical engineers and human anatomists this country affords. Upon their recommendation various items in general surgical usage will be investigated as to their soundness and appropriateness. Correct and appropriate ways and means will be recommended in place of what is known to be inappropriate and unsound. In its work this association is free to enter the field of chemistry or bone and muscle dynamics or any other field under the broad subject of physics. In my paper a few examples of surgical and anatomical shortcomings will be presented.

Membership in the Surgical Engineers' Association is open to all truth loving men, capable of discerning and following facts wherever facts may lead them. There will be no medical or other kind of politics in this association. There are no dues nor membership fees except conscientious mental efforts that will contribute towards putting surgeons and surgery on a sound mechanical basis for the first time in the history of surgery.

Discussants: D. S. Wiggins, Newcastle; M. E. Klingler, Garrett.

SECTION ON OPHTHALMOLOGY AND OTOLARYNGOLOGY

(GRILL ROOM, ROBERTS HOTEL)

Thursday, 2 P. M.

1. CARL H. MCCASKEY, Indianapolis.
Chairman's Address.

2. ALBERT E. BULSON, JR., Fort Wayne.
Subject: Cycloplegics in Refraction Work.

Abstract.—Cycloplegics necessary for satisfactory refraction work.

Atropin, hyoscin and homatropin in the order named considered most efficient, though homatropin generally employed in adults and supplemented by stronger cycloplegics when indicated.

Complete paralysis of accommodation is a necessary condition for estimating the static refraction.

Method of using cycloplegics and reasons for failure to secure satisfactory results.

Idiosyncrasy.

Retinoscopy absolutely necessary in refraction work, but retinoscopy practically useless without cycloplegia.

Examples of differences in refraction as determined with and without cycloplegics as also with cycloplegics of different strengths.

Mild and strong cycloplegics.

Rules for prescribing glasses after determining the static refraction.

Discussant: Thomas C. Hood, Indianapolis.

3. WILLIAM B. CHAMBERLIN, Cleveland, Ohio.
Address: Endonasal Operations on the Lachrymal Sac.

4. F. S. CUTHBERT, Kokomo.
Subject: System and Thoroughness in Eye Examination and Treatment.

Abstract.—Essentials are a capable diagnostician and a faithful observance of routine. First examination should establish an accurate diagnosis in most all cases. Great demands on examiner's eyesight. Snap diagnosis frequently fails. Searching personal history. Steps in routine examination. Value of retinoscopy. Cycloplegics. Method of treating posterior synechia. Thoroughness in office treatments versus "drops" used in the eyes at home.

Discussant: W. A. Hollis, Hartford City.

Friday, 9 A. M.

1. W. F. HUGHES, Indianapolis.
   Subject: Cataract Extraction and Its Complications.

Abstract.—The extraction of cataract has been, and is, probably the most frequently discussed subject in ophthalmology. The ideal procedure has not yet been fully developed. The prognosis should be carefully guarded.

A cataract extraction by a skillful, experienced operator, under the most favorable conditions, may come to failure, often when least expected. The operation should be done only under the most favorable conditions of the patient and surroundings.

The mode of procedure should be thoughtfully selected for each individual case with a view of avoiding complication both during the operation and the subsequent healing process. Complications should be met promptly as they arise.

Secondary cataract operations should be done with the same care as the primary. Some risk is involved.

Discussant: Frank A. Morrison, Indianapolis.

2. W. S. TOMLIN and D. S. ADAMS, Indianapolis.
   Subject: Phases of Chronic Pharyngeal Infection.

Abstract.—Focus of attention on operative terminology has led the public and also the profession to think in terms of tonsillectomy and adenectomy as being the goal of throat procedures. While these must be prominent in attempts to clear pharyngeal spaces of infection, they do not comprise all that is necessary in many cases. Infection bearing lymphoid tissue in the plica, around the eustachian tubes and more remote recesses, may be and are overlooked in some cases to the detriment of patients and the discredit of the work and the operator. Deep chronic abscesses extending to the digastric fossa in patients who say that they "have not had a sore throat in months or years" may be overlooked and left after a perfect tonsillectomy and an adenectomy which seems to sweep the pharyngeal vault quite clear by usual standards may leave adhesions and pathologic areas in fornices only possible to be reached with changed positions and instruments under direct guidance of the educated finger or vision.

Case reports.

Discussant: K. T. Brown, Muncie.

3. G. W. SPOHN, Elkhart.
   Subject: Eye Drainage.

Abstract.—Definition. Descriptive anatomy and physiology. The need of a drainage system as well as a system of sewerage. Occlusion of the punctum, the lachrymal or nasal duct. Etiology of occlusions. The more common pathological conditions of the drainage system. The constant passing of probes for dilation on a par with Politzerization of the tympanum of the ear.

Prognosis dependent upon the reserve, the vitality or the reconstructive power of the patient.

Treatments.

Conclusions.

Discussant: C. Norman Howard, Warsaw.

REPORT OF THE SECRETARY

House of Delegates, Indiana State Medical Association:

Gentlemen: I beg to report that so far this calendar year there have been 2,588 paid-up memberships in the Association, an increase of seventeen over the corresponding time for last year. In another column of this issue of THE JOURNAL you will note that this increase is not distributed evenly over all the councilor districts, some districts being much behind last year's quota and some being in excess of last year.

Our delegate to the St. Louis session of the American Medical Association, Dr. George F. Keiper, reports that he presented the name of Dr. G. W. H. Kemper of Muncie to the House of Delegates of the American Medical Association, and, that since Dr. Kemper had complied with all requirements, he was elected to Affiliate Fellowship in the American Medical Association, an honor but rarely conferred upon our members.

Respectfully submitted.

CHARLES N. COMBS, Secretary.

REPORT OF THE COMMITTEE ON ADMINISTRATION AND MEDICAL DEFENSE, INCLUDING REPORT OF THE TREASURER

House of Delegates, Indiana State Medical Association:

Gentlemen: You will remember that in last year's report mention was made of the fact that all cases acted upon by the Medical Defense Committee are given a serial number so that reference may be made to individual cases without mentioning any names.

One year ago in our report to the House of Delegates, there were seventeen cases pending in the hands of the Committee. Following is the detailed progress of these cases during the past twelve months:

No. 67 Still pending.
No. 68 The appellate court reversed the decision of the lower court so that it is now in favor of the defendant. However, the case will go before the Supreme Court for final decision.
No. 73 The Supreme Court affirmed judgment of $500.00 against defendant. Cost to Association, $88.50.
No. 83 Still pending.
No. 85 Never came to trial.
No. 86 Dismissed on account of lack of evidence.
No. 90 Verdict for defendant.
No. 92 Still pending.
No. 94 Settled out of court. No expense.
No. 96 Still pending.
No. 98 Never came to trial. No expense.
No. 99 Thrown out of court. No expense.
No. 100 Still pending.
No. 102 Thrown out of court. No expense.
No. 103 Verdict for defendant.
No. 105 Verdict for defendant. Expense $265.00.
No. 106 Still pending.

Since September 1, 1921, there have been referred to the Committee eight new cases, and the status of these cases is as follows:

No. 107 Pending.
No. 108 Pending.
No. 109 Member died March, 1922. Expense $50.00.
No. 110 Pending.
No. 111 Pending.
No. 112 Pending.
No. 113 Not entitled to defense. No expense.
No. 114 Pending.

This leaves fourteen cases in the hands of the Committee, Nos. 67, 68, 83, 92, 96, 100, 106, 107, 108, 109, 110, 111, 112 and 114.

In the financial report, you will note that the expense of the Committee so far this year has been only $315.00. For the time being at any rate, the Committee stands justified in continuing its present policy as to attorneys. A few years ago our attorney's salary alone was $1,500.00 a year in addition to other expense. Indiana is remarkably free from malpractice suits. Contrasting with our $315.00 is the statement that in Iowa last year the Association spent $5,000.00 for attorneys' fees alone.

The remaining members of the Committee wish to pay their sorrowful tribute to the memory of one whose name is signed below. Dr. Frank B. Wynn has been a member of this Committee since 1917, and a very large share of the success in the administration of the affairs of this Committee is due to his earnest and untiring efforts.

FINANCIAL REPORT

Medical Defense Fund.

Receipts:

Balance on hand at last published report, January 1, 1922		$ 587.91
Medical Defense Apportionment, 2,588 members at 75 cents each		1,941.00
Liberty Bonds		5,000.00
Total		$7,528.91

Disbursements:

Case No. 105	$265.00	
Case No. 109	50.00	
Total		315.00
Balance on hand Sept. 1, 1922—Cash		$2,213.91
Liberty Bonds		5,000.00

The report of the Treasurer is as follows:

Receipts:

Balance on hand last printed report, January 1, 1922		$ 9,016.86
Membership dues (2,588 members)		10,352.00
Sale of furniture		155.00
Total		$19,523.86

Expenditures:

THE JOURNAL, $2 per member	$5,176.00	
Medical Defense Fund, 75c per member	1,941.00	
Secretary's stenographer	511.50	
Postage and Incidentals	72.96	
Printing	191.77	
Typewriter	102.50	
Councilors' expenses	66.68	
Legislative Committee	519.75	
Bonds for Treasurer	56.00	
Balance due Claypool Hotel	15.00	
Storage of furniture	36.94	
Total		8,690.10
Balance on hand Sept. 1, 1922		$10,833.76

Respectfully submitted,

CHARLES N. COMBS, Treasurer.
E. M. SHANKLIN, Chairman.
GEORGE R. DANIELS.
FRANK B. WYNN*.

REPORT OF THE COMMITTEE ON MEDICAL EDUCATION

House of Delegates, Indiana State Medical Association:

Gentlemen:

1. *Medical Education in America.* Perhaps the most outstanding change in Medical Education in the past year is the emphasis placed on Hygiene and Preventive Medicine. Courses three times the length of former courses have been arranged in most schools while a few schools are offering courses for those having the M.D. degree and requiring two to three years for their completion.

It seems probable that the low ebb in medical school enrollments has been reached and passed. Throughout the country there is an increase in freshman medical enrollments.

2. These general tendencies are noted in our own medical school. The course in Hygiene has been increased to about one hundred hours. The freshman medical class last year was the largest since the adoption of the two-year collegiate work for entrance. There were 112 in last year's freshman class. It has been necessary this year to increase the scholarship requirement in premedical work with the object of preventing matriculation of the poor or lazy student instead of carrying him for a year and having to fail him at the end of a year.

*Deceased.

The progress of the Riley Memorial Hospital and the need of a Psychiatric Hospital are outstanding features of Medical Education of Indiana.

Respectfully submitted,

BURTON D. MYERS, Chairman.

REPORT OF THE COMMITTEE ON HOSPITAL STANDARDIZATION

House of Delegates, Indiana State Medical Association:

Gentlemen: No systematic hospital survey of the State has been made this year. It was not deemed advisable on account of the expense in money and time. In addition the various hospitals are known to be in fair to good condition; some are in excellent physical and scientific standing.

St. Elizabeth's Hospital (Lafayette) has been admitted to the approved list for interne training by the A. M. A. Committee; several other Indiana Hospitals will be recommended for similar accredited standing during the next year. Improvement is noted all along the line.

Respectfully submitted,

ALBERT E. STERNE, M.D., Chairman.

ABSTRACT OF REPORT OF COMMITTEE ON AUTOMOBILE INSURANCE

House of Delegates, Indiana State Medical Association:

Gentlemen: Work of the Committee, based on the fact that the doctor should be a preferred risk for automobile insurance. Usual rates on automobile insurance prohibitive. The Committee seeks to obtain insurance for members of the Medical Association, the rates proportionate to the moral hazard and the actual risk.

Three procedures considered, to-wit: One, insurance with standard stock companies. This was unsuccessful as no concessions would be made by stock companies on account of dis-organization of their agency force. Two, the organization of a stock company or a reciprocal association within and for the Medical Association. This was found to be impracticable by reason of lack of time and the legal requirements covering the situation. Three, the execution of a contract between the State Medical Association and some reciprocal organization for the writing of individual policies at just and proper rates. Legal opinion was necessary to show the rights and liabilities of policyholders in a reciprocal organization. Firm of Emison & Hoover employed to render legal opinion covering the entire subject of automobile insurance.

Abstract of Attorneys' Opinion: Review of entire subject of Inter-Association Insurance. Legal requirements on Attorney-in-Fact. Attorney-in-Fact is sole negotiator. He represents the policyholders in his relation with other policyholders. His powers limited by articles of agreement. Method of organization of a reciprocal concern. The expenses of the office maintained by the Attorney-in-Fact is the sole expense with such insurance, other than losses. Liability of policyholder: This is governed by the law of Indiana as interpreted by the Attorney General on September 1st, 1921, as not exceeding that which is specified in the original association agreement. It is a several liability which can be limited as the subscribers see fit. Legal disadvantages: This consists in the fact that legal services can be had on any subscriber if the Attorney refuses to appear in defending the suit, but the subscriber has recourse against the Attorney. In the opinion of the legal authority, this is only a theoretical disadvantage as the Attorney-in-Fact would undoubtedly appear. Discussion of mutual insurance which operates under the law of 1915. Permission by statute to reinsure.

Requirement that the cash premium must be expressed in the policy. Certain requirements and limitations placed upon the corporation by law. Legal requirements as to admitted assets. Rights and liabilities of the insured: Provisions of statute for cancellation or forfeiture of policy. Payment of premium is a question of contract. Mutual or reciprocal insurance a question of contract. The insured is liable for such assessment as may result from liability or accidents which occur during the life of his policy.

Offer of the Standard Auto Insurance Association found to be the lowest and best offer. Submitted in full in the report. Standard Auto Insurance Association a reciprocal concern under laws of Indiana, with firm of Bainum-Phillippe Company as Attorney-in-Fact with central office at Vincennes, Indiana. Sworn statement from the Bainum-Phillippe Company showing the stockholders of that concern. Investigation by Committee shows that the stockholders of the Bainum-Phillippe Company are men of integrity, business ability and financial stability, with a satisfactory reputation where they are known.

The Committee recommends that the State Medical Association enter into an agreement with the Standard Auto Insurance Association for the writing of individual policies in accordance with the proposal of Standard Auto Insurance Association. The Committee further recommends that a committee be appointed by the State Medical Association for the ensuing year for the purpose of maintaining a connection between the State Medical Association and the Standard Auto Insurance Association and to continue during that year to have the subject of automobile insurance under consideration.

Respectfully submitted,

JAMES N. McCOY, Chairman.

REPORT OF COMMITTEE ON SCIENTIFIC WORK

House of Delegates, Indiana State Medical Association:

Gentlemen: The scientific program prepared for this session constitutes the report of your Committee on Scientific Work.

Respectfully submitted,

LARUE D. CARTER, Chairman.

REPORT OF COMMITTEE ON ARRANGEMENTS

House of Delegates, Indiana State Medical Association:

Gentlemen: On Wednesday evening there will be a smoker at the New Hotel Roberts that promises to surpass any smoker that has ever been given by the society entertaining the State Association. Some real stunts have been provided and an entertainment that is well worth the time of any physician in the state to attend has been arranged. We feel sure that this will be, from the standpoint of entertainment, the most valuable part of the session at Muncie.

On Thursday evening there will be an open meeting for doctors and their families, and also the general public is to be invited, at the High School Auditorium. At this meeting there will be, first, a musical program, from 8:00 to 8:30, and at 8:30 Dr. W. A. Evans of Chicago, who has the Health Column of the Chicago Tribune, will deliver a popular address. This entertainment will be broadcasted by the Muncie Press Broadcasting Wireless Station. This station operates on 355 meters and should be heard at least all over the state.

The Local Committee on Arrangements felt that the above plan of entertainment on Thursday evening would be more profitable than attempting to stage a banquet at which a scientific program was provided, as the ladies, no doubt, will be more interested in a subject such as Dr. Evans can so ably present than they would be in a scientific program. Also, it will give the public a chance to become better acquainted with medical ideals, and this, it occurred to us, is very essential at this time.

The following program has been arranged for the pleasure of the ladies attending the State Medical Meeting, and we would appreciate it if the doctors will communicate with the Local Committee on Arrangements and let us know how many ladies will accompany them, so that we can have some idea as to the number for which we should prepare.

Wednesday evening the ladies will be entertained at the Wysor Grand Theatre by moving pictures and vaudeville. The management of this theatre has assured us that they will make special efforts to arrange a program that will be very suitable for this occasion. Thursday noon a luncheon will be served at the Delaware Country Club, after which there will be a musical in the afternoon. Thursday evening the ladies will be expected to attend the public meeting at the High School Auditorium, at which Dr. Evans will speak. Friday, at 10:00 a. m., there will be an automobile ride over the city, visiting the places of interest. Some of the places which will be visited are as follows: Ball Brothers Fruit Jar Company, General Motors Corporation, parks, Indiana State Normal School, Durant Motors, etc. Twelve to one will be spent at "Wild Banks" Farm, the country home of Dr. and Mrs. C. M. Mix of this city, returning to the Hotel Roberts at 1:30. The committee in charge of the ladies' entertainment is as follows: Mrs. I. N. Trent (Chairman), Mrs. L. L. Ball, Mrs. Earl Green, Mrs. U. G. Poland, Mrs. C. E. Miller, Mrs. C. M. Mix and Mrs. S. G. Jump.

The Local Committee also urges that the various medical fraternities, class reunions, etc., be held either on Thursday or Friday noon, and if any such luncheons are being planned we will appreciate it if they will get in touch with us *immediately* so that we can make the necessary reservations at the hotels.

A golf tournament is being arranged for and we would appreciate it if any doctor who cares to play golf while he is here attending the State Medical Association meeting, or even cares to enter the tournament, will get in touch with either Dr. F. G. Jackson or Dr. C. A. Leatherman of this city *immediately*, who have this matter in charge.

On Thursday evening there will be dancing for all who care to indulge at the Hotel Roberts, after Dr. Evans's address, as late as they care to dance.

Respectfully submitted,

B. R. KIRKLIN, Chairman.

REPORT OF COMMITTEE ON PUBLIC POLICY AND LEGISLATION

House of Delegates, Indiana State Medical Association:

Gentlemen: Your committee having to do with Legislation and Public Policy desires to make the following report:

No Legislative activities are reported for the reason that the Legislature has not been in session for more than special and specific purposes during the life of this committee.

Your committee would recommend to this Association that it at once take steps to better organize the profession, in defense of its own ideals, that a much larger number of the profession in the state be brought into the fold of this organization, and especially that it adopt means of bringing the profession into a much closer relationship to the public.

FRANK W. CREGOR, Chairman.

EDITORIALS

OUR PRESIDENT

William R. Davidson, President of the Indiana State Medical Association 1921-1922, was born in Evansville, Indiana, in 1875, of Scotch descent. His early education was received in the Evansville schools. He graduated in science from Wabash College, Crawfordsville, in 1896, and immediately thereafter entered Rush Medical College, Chicago, from which he received his medical degree in 1899, beginning the practice of medicine at Evansville at once, where he has continued to practice up to the present date. Post-graduate work was taken at Harvard Graduate Medical School, and New York post-graduate schools.

Dr. Davidson was one of the original members of the Board of Councilors of the Indiana State Medical Association when first organized, and later served as vice-president of the Association. He is a Fellow of the American College of Surgeons; charter member of Evansville Rotary Club; member of all Masonic bodies; past commander Knights Templar; and member of numerous local clubs. During the World War he served in France as Chief of Surgical Service, Base Hospital No. 120.

In 1905 Dr. Davidson was married to Miss Helen M. Chick, of Boston, Massachusetts. They have one son, Donald, fifteen years of age, now a senior in Central High School, Evansville.

Dr. Davidson has been associated in the Walker Hospital with Dr. Edwin Walker and Dr. James Y. Welborn since 1905, and since the death of Dr. Walker recently, has acquired an interest in the hospital.

The Indiana State Medical Association is fortunate in having so worthy a President, and we anticipate that this annual session, under his leadership, will be one of the best in the history of the Association.

UNETHICAL ADVERTISING

Since the publication of the July number of THE JOURNAL, in which we discussed briefly the subject of unethical advertising on the part of physicians, we have received a number of letters from readers touching upon the subject. Some of the letters heartily commend the suggestion that something should be done to check the tendency on the part of many doctors to unethically advertise themselves, while other letters are from writers who apparently desire to apologize for their own actions by putting forth unfounded claims that practically all doctors advertise unethically. A few of the correspondents make the bold, indefensible and untrue statement that *all* of the leaders in the medical profession are guilty of newspaper advertising. Aside from the letters concerning the matter, we have been fairly deluged with newspaper clippings which really show to what an extent the practice of many medical men in securing newspaper publicity has extended.

In carefully analyzing the correspondence, and especially the newspaper clippings, we find that in the main the men who try to boost themselves by newspaper publicity are residing in the smaller cities and towns, and that even there it is confined to one or two men in each locality. In making this statement we are not unmindful of a few breaches of professional ethics, to say nothing of acts that are in exceedingly bad taste, as seen in the newspaper and magazine write-ups of a few of the so-called "clinics" in Indiana. A striking example of this is the laudatory illustrated write-up of one of the Indiana "clinics" in the August number of the *American Magazine*, and almost a duplicate of the same as sent out by one of the press associations and reproduced in many of the daily and weekly papers of the country. Aside from this some of the so-called "clinics" have been featured in the photogravure sections of Sunday papers and written up as special articles for various lay and religious papers. Also, some of the clinics have not hesitated to mail out broadcast to the laity illustrated brochures picturing elaborate offices and mentioning the various paraphernalia employed and recounting the unusual qualifications and skill of the various members of the "clinic".

The whole thing is more or less nauseating, and so smacks of commercialism of the rankest sort that it is no wonder that those men in the medical profession who do not resort to such unethical practices, and there are many such, feel grieved that their confreres will stoop to such practices. It is idle talk to say that the leaders in the medical profession resort to or ever did resort to unethical newspaper advertising to further their own ends, for while now and then one of the leaders may have been guilty of such practices in his younger days, yet we venture the assertion that for the most part very few of them are guilty. As young and struggling men in the medical profession they followed the straight and narrow course, and they are doing so yet, just as hundreds of younger men in Indiana are doing now. However, it is a little discouraging for the younger

men, who want to be honest and want to be ethical, to note the frequency with which some of the older men are guilty of breaches of ethics and decency.

As we already have stated in previous editorial comments on this subject, it is time to live up to our standards of conduct or else have no rules and let every man do as he pleases whether his conduct meets the approbation of his confreres or not. It may not be possible to control the action of patients, who in rare instances desire to parade their ills and the names of their doctors in the daily papers, and especially is this true when patients reside at a distance and give their news items to their home papers. However, as we have stated many times, there probably isn't a newspaper editor and proprietor in the country who will not respect the wishes of medical men and refrain from publishing the names of doctors in connection with medical and surgical cases if requested to do so. The better class of people in every community know that a doctor is "tooting his own horn" when they see that doctor's name appearing repeatedly in the lay papers in connection with the treatment of patients, and the practice of seeking such notoriety is looked upon unfavorably by the class of lay persons whose good opinion every reputable doctor should court. The so-called "clinics" are no better than individuals when they resort to the kind of magazine and newspaper publicity to which our attention has been directed quite recently and referred to in this editorial comment.

The propriety of advertising of various kinds is covered by the new code of ethics from which we again quote:

"Solicitation of patients by physicians as individuals, or collectively in groups by whatsoever name these be called, or by institutions or organizations, whether by circulars or advertisements, or by personal communications, is unprofessional. That does not prohibit ethical institutions from a legitimate advertisement of location, physical surroundings and special class—if any—of patients accommodated. It is equally unprofessional to procure patients by indirection through solicitors or agents of any kind, or by indirect advertisement, or by furnishing or inspiring newspaper or magazine comments concerning cases in which the physician has been or is concerned. All other self-laudations defy the traditions and lower the tone of any profession, and so are intolerable. The most worthy and effective advertisement possible, even for a young physician, and especially with his brother physicians, is the establishment of a well-merited reputation for professional ability and fidelity. This cannot be forced, but must be the outcome of character and conduct. The publication or circulation of ordinary simple business cards, being a matter of personal taste or local custom, and sometimes of convenience, is not *per se* improper. As implied, it is unprofessional to disregard local customs and offend recognized ideals in publishing or circulating such cards.

"It is unprofessional to promote radical cures; to boast of cures and secret methods of treatment or remedies; to exhibit certificates of skill or of success in the treatment of diseases; or to employ any methods to gain the attention of the public for the purpose of obtaining patients."

As a solution of the problem occasioned by the growing tendency on the part of many doctors, especially in small towns, to seek newspaper publicity and notoriety, we suggest that the Indiana State Medical Association adopt a resolution in which unethical newspaper advertising is condemned as being distasteful to the medical profession, and politely requesting the newspaper editors or managers of the state to refrain from publishing the names of doctors in connection with medical and surgical cases. Such a resolution should assure the editors that medical men at all times will furnish the newspapers with such facts as the public ought to know. However, the giving out of such facts does not constitute a breach of ethics or propriety which every doctor is bound to respect. This resolution should be sent to every lay periodical in the state, and we venture the assertion that there isn't a newspaper editor or manager in the state who will not respect the request that is made.

Certainly it is time to do something to curb the tendency toward the rankest kind of commercialism on the part of many medical men. Already we are threatened with annihilation by so many things from without that it seems unnecessary to dwell upon the necessity of correcting the evils from within, but we must bring our medical men into closer harmony, and to a realization of the fact that we are practicing a profession and not a trade. If we cannot sustain the principles and traditions of the profession, then we deserve to perish.

THE RETIREMENT OF DR. HURTY

After more than twenty-five years of long and active service as a health commissioner for Indiana, Dr. John N. Hurty voluntarily retires and has been succeeded by Dr. William F. King, who for twelve years has been Dr. Hurty's assistant. Dr. Hurty's administration has been characterized by vigorous enforcement of the health laws, and by an effort for the betterment of public health and sanitary conditions in Indiana which has placed the state in the front rank of those that appreciate the value of public health work. Many complimentary things have been said concerning Dr. Hurty's work as a public health official and he is deserving of all of the praise that has been accorded him, not only in this state but in other states as well. Always active and pugnacious, though not always tactful, he sometimes has made enemies through his conduct and the tenacity with which he has stuck to a given course of action which he thought was right, but in the end he nearly always has secured endorsement and praise from even his enemies, as it has been recognized that back of all has been an ability and a purpose which has redounded to the welfare and best interests of the people of Indiana. His service has placed Indiana in a high place among the states that try to solve public health problems;

and it may be safely said that to Dr. Hurty alone is due nearly all of the credit for the protection that has been given the Indiana people in public health matters and for the place that Indiana has been given in public health work.

THE CONDUCT AND POLICY OF THE MAYO CLINIC

As everyone knows, a good deal of criticism of one kind or another has been aimed at the Mayo brothers of Rochester, Minnesota, and lately against the Mayo Clinic. Recently, or subsequent to our editorial in the July number concerning unethical advertising, a number of Indiana doctors have seen fit to say some uncomplimentary and even vicious things concerning the Mayo Clinic in its relation to unethical newspaper publicity. We are not interested in the Mayo Clinic in any way whatsoever, but we are interested in the question of fair play and we resent the charge that the Mayos or any considerable number of the prominent members of the medical profession are guilty of anything that can be construed as unethical or in the slightest degree tinctured with the rank commercialism about which we have complained and which we shall continue to complain. The trouble of it is there are altogether too many medical men who will make malicious and unsustained accusations concerning confreres of whom they are jealous because such confreres possess more attainments and have made greater success in the profession; or in attempts to defend their own misdeeds they try to make out that everybody else is as bad as they are. Some of the Indiana doctors have freely charged that the Mayos are the rankest kind of advertisers, that they are fee dividers and are guilty of all kinds of unethical conduct. All of this is untrue and is so palpably false and inconsistent as to merit no answer on the part of those who are being accused. The fact of the matter is the Mayo brothers will challenge any person to produce the slightest evidence that either of them or anyone connected with the Mayo Clinic has been guilty of unethical conduct.

In this connection it may be well for our readers to know that the Mayo Clinic is not a personal business conducted by the Mayo brothers, but is an institution. Its funds and properties are controlled by a board of nine trustees, and its professional control is through a council of eleven members, six elected by 121 members of the permanent staff and five appointed by the board of trustees. No person directly profits from the clinic except as paid a salary. Any residue after salaries have been paid is added to the permanent endowments. The Mayo Clinic, while conducted along the highest ethical standards also is conducted in a businesslike way which might well be imitated by other professional men. In fact the medical profession should be thankful that the Mayos have not been influenced by any maudlin sentiment nor exercised any unfair business tact in order to increase the amount of their work or income, and, while at all times bestowing charity where charity is due, they have not been guilty of pauperizing the community as is the case with some of the large clinics in our cities. In fact the Mayo Clinic issues a printed statement of which the following is a copy:

"1. Every patient who comes to the Clinic receives the care and attention necessary without regard to financial status, social condition, race or creed. What he receives is measured by his necessities, not by his ability to pay. While the Clinic is ready and willing to give freely of its services to the worthy poor, each patient who is able to pay a fee is required to do so. The hospitals in Rochester are not owned by the Clinic although under its medical and surgical direction. Every patient must be provided with money for his maintenance, hospital expenses and transportation.

"2. All the moneys that are received by the Mayo Clinic, beyond a reasonable and just return to its staff, are used to create endowments the income of which shall be devoted perpetually to the relief of human illness, to the advancement of research as to the cause and prevention of disease, and to medical education and such other welfare movements as are correlated with health problems.

"3. The Mayo Clinic, its endowments, physical equipment, lands and other properties, are held by trustees in perpetuity for the sick of this and future generations."

We do not think that the Mayo Clinic needs any defense, in fact we believe that other "clinics" could well follow the Mayo Clinic in its business and ethical conduct even if not duplicating the quality of service rendered, but we believe that something definite should be said in answer to some malicious charges that have been made by a few Indiana men who, while free to condemn, have not been able to offer acceptable proof.

USELESS COMMITTEES

Ever since the organization of the Indiana State Medical Association we have tolerated and perpetuated a number of useless committees. This is not saying that the Association as an organization and the individual members of it would not profit through the existence of such committees if they did their work properly, but the fact of the matter is those committees, with but one or two exceptions, have failed absolutely to do anything worth while, and so far as their usefulness is concerned they might as well not have existed. It takes a charge of dynamite to make some of the committees functionate, and we might as well have committees to procure Pierce-Arrow motorcars for the inhabitants of Mars as to have some of the committees that we have now. Every year the secretary of the Association asks the chairmen of committees to get their reports ready for presentation at the annual session and to have the same published in the presession number of THE JOURNAL. Through the year most of the

committees exist only on paper, and at the eleventh hour each chairman usually after much urging prepares a perfunctory report, based on little thought and less action on the part of the committee, and the same is perfunctorily approved by the House of Delegates and that ends the matter. Occasionally a committee like that on Public Policy and Legislation really does some work, but such a condition of affairs is due to a chairman who is devoted to the interests of the Association and who is willing to give his time and his attention to the work that has been assigned him. Dr. W. N. Wishard, for many years the chairman of that committee, deserves unstinted praise for the work that he has done for the Association, and the work has not been done without great effort and much sacrifice of time. His committee is about the only one that ever has done any real work, and the report of which was worth the effort put forth to prepare it. This brings up the question of the appointment of the committee members. Presidents cannot be too careful in the selection of those who are to act upon important committees, for a drone as a chairman of a committee may nullify absolutely the effects of such committee. Men should be selected for the committees because of their peculiar qualifications for membership on those committees and their willingness to work. The few committees which our Association has at the present time really are needed, but most of them could be abolished if we are to judge from the amount and character of work that they have done during the last few years. By all means let us have some sort of an awakening on the part of those who are representing the Association on important committees or else do away with the committees entirely and save time and worry.

THE GORGAS MEMORIAL

The American Medical Association, through a special committee, is making an appeal for funds to be used as a fitting memorial to mark the humanitarian services of the late General William C. Gorgas and his beneficent influence upon the life and work of mankind throughout the world. It has been decided that this memorial shall take the form of a scientific institute for the study of tropical diseases and preventive medicine, and Panama City has been selected as the place for that institute. The plan is to build at Panama an institute for the study of tropical and infectious diseases, with a hospital, laboratories, departments for research and all other facilities required in an institute of this character erected and administered according to the most progressive, modern ideals. The government of Panama has donated the great Santo Tomas Hospital, and also the ground on which it is proposed immediately to construct the buildings as they have been described. In conjunction with this work in Panama there will be established in Tuscaloosa, Alabama, the Gorgas School of Sanitation for the purpose of training public health workers, sanitary engineers and public health nurses, especially educated to deal with the problems peculiar to the Southern states.

An endowment of six and one-half million dollars will be required to enable the commission to carry on the plans which have been formed. The physicians of our country and especially the members of the American Medical Association surely will not disregard the memory of a former president and one who has done so much for the welfare of the people of the whole world in tropical and semi-tropical countries and in all places subject to the inroads of infectious diseases. The campaign for funds is to be international. A large response is expected from North, Central and South America, since the nations of these countries have been the chief beneficiaries of the labors of General Gorgas. It is fitting that his co-workers of the American medical profession should be requested to respond generously to this appeal. It is hoped that every member of the American Medical Association will make as liberal a subscription as possible. Any sum will be gratefully accepted. Checks should be drawn to the order of the "Gorgas Fund" and should be mailed to the American Medical Association, 535 North Dearborn Street, Chicago, Illinois.

EDITORIAL NOTES

DEAR DOCTOR:

THE JOURNAL and the Cooperative Medical Advertising Bureau of Chicago maintain a Service Department to answer inquiries from you about pharmaceuticals, surgical instruments and other manufactured products, such as soaps, clothing, automobiles, etc., which you may need in your home, office, sanitarium or hospital.

We invite and urge you to use this Service.

It is absolutely FREE to you.

The Cooperative Bureau is equipped with catalogues and price lists of manufacturers, and can supply you information by return mail.

Perhaps you want a certain kind of instrument which is not advertised in THE JOURNAL, and do not know where to secure it; or do not know where to obtain some automobile supplies you need. This Service Bureau will give you the information.

Whenever possible, the goods will be advertised in our pages; but if they are not, we urge you to ask THE JOURNAL about them, or write direct to the Cooperative Medical Advertising Bureau, 535 N. Dearborn St., Chicago, Illinois.

We want THE JOURNAL to serve YOU.

The Time—Wednesday, Thursday and Friday, September 27, 28 and 29th.

The Place—Muncie.

The Event—The annual session of the Indiana State Medical Association.

INDIANA roads were never better. Railroad and interurban service was never as bad. Why not go to the Muncie Session by automobile. If you do not know the way, ask a representative of the Hoosier Automobile Association or consult any good road map.

A CHIROPRACTOR baby specialist is a new one in the field of special practice, as evidenced by the advertisement of a chiropractor who is locating in one of the central Indiana cities. It is bad enough to punish adults by the pulling and mauling of chiropractors without subjecting babies to such maltreatment.

THERE is no reason why the "clinics", or group practice of any kind, should not conform to the restrictions governing the individual physician so far as ethics are concerned. To resort to commercial practices in soliciting or in the securing of patients, whether through unethical newspaper advertising or in any other way, should not be condoned in them any more than it is condoned in the individual physician.

THE smoker on Wednesday evening at the Hotel Roberts, according to the announcement of the Committee on Arrangements for the Muncie session of the Association, promises to surpass any smoker that ever has been given by a society entertaining the Association. Some real "stunts" have been provided, and an entertainment that is well worth the time of any physician in the state to attend has been arranged. Members are urged to come to Muncie early in order that they may not miss this treat.

WITH the opening of the schools in the fall there comes the usual increase in the number of communicable diseases among children. Much can be accomplished in stopping the spread of disease by careful school inspection, but we have no patience with the inspection that occurs in some schools where so-called nurses and others who have never had any medical training are given the responsibility of the inspection. Incidentally it is time to preach the value of vaccination not only against smallpox but diphtheria as well.

LAY control and dictation of the management of the institutions in which medical men are interested directly or indirectly is bound to come unless something is done to prevent it. Not alone this, but lay control of everything pertaining to the practice of medicine eventually will come unless the spineless doctors who fail to see the growing tendency of the times awaken to the danger and put on their fighting clothes in an attempt to save a reasonable amount of independence for themselves. This is no idle dream, and those who think differently will have occasion to learn the truth perhaps when it is too late.

IT is charged that the state journals, including their editorial policies, are controlled and dominated by the American Medical Association. Nothing can be further from the truth. We can name two or three state journals that are not only independent in thought but usually opposed to many of the A. M. A. policies and do not hesitate to say so. Even this JOURNAL declines to receive dictation from anyone, and the A. M. A. office in Chicago never has and never will influence the editorial opinions unless such influence is in keeping with the ideas of the editor and the members of the council who are responsible for the publication.

THE Physicians' Protective Association of Buffalo, made up of 450 of the 857 physicians in that city, is carrying on an energetic fight against the pauperization of the public through free medical services in local hospitals. Abuses are tolerated under the mask of public health and the Buffalo physicians believe that it is time to put a stop to the practice of making dependents and paupers of people who are able to pay something for the services rendered. The question concerns the public more than it does the medical profession, for no community can afford to tolerate widespread and unnecessary pauperization in the form of any kind of unnecessary free aid.

THE Muncie medical profession is composed of a live bunch of men. They are doing things in a medical way, and on the surface they seem to be working in perfect harmony. They extend an unusually cordial welcome to those who will attend this year's session of the Indiana State Medical Association, and much is promised in the way of enthusiasm and entertainment. Anyway, the scientific program is not the greatest attraction offered by our annual sessions. The spirit of good fellowship and the opportunity to get acquainted with one another is worth much in stimulating cooperation and harmony among the medical men of the State, and the Muncie medical men are going to help along this spirit.

THE chiropractors held a convention in Fort Wayne the last week in August. They advertised the event extensively in the newspapers and by placards which were posted in conspicuous places, to say nothing of a parade headed by a band, through the principal business streets. The whole thing reminded us of a one-ring circus, monkeys and all. The program for this convention, as published in the newspapers, showed that the chiropractors do not discuss diseased conditions, and cause and treatment, but they do discuss such questions as how to advertise and how to get the money, thus showing, as is well illustrated by their catalogs and other literature, that chiropractic is a business and not a profession.

IN his presidential address at the St. Louis session of the A. M. A. Dr. George E. de Schweinitz said some pertinent things concerning the necessity of acquainting the public with the aims and objects of the medical profession and, in commenting on this, a pastor of a leading St. Louis church says "to educate public opinion is a painful duty but it is one that must be faced and each of the great professions has its allotted task in keeping the public well informed on the subject on which it can speak with authority. * * * Does the medical profession as a whole take its proper part in guiding and influencing public opinion in those matters wherein it alone can speak with authority?"

MEDICAL specialists of one kind or another are getting so numerous that in a short time there will be no old fashioned general practitioners. It wouldn't be so bad if the specialists were all qualified, but unfortunately a large proportion of the so-called specialists are unscrupulous and unqualified. The American College of Surgeons is supposed to discriminate between the qualified and unqualified surgeons but has failed to do so in many instances. The time will come when societies will have a house cleaning and show up the untrained specialists. Already some of the societies composed of specialists have drawn the line, but the trouble of it is before they drew the line a lot of ill-trained men gained membership. There are hosts of other untrained men who never will make application for membership in such societies and probably do not care to do so.

WE still receive newspaper clippings from Elwood indicating that the name of one of the doctors there, president of the county medical society, appears in the daily papers every day or so in connection with a report of medical and surgical cases, and we have been asked by other doctors, "What is the State Medical Association going to do about it?" As a matter of fact, the State Medical Association will do nothing about it, for each county medical society is the judge as to the qualifications of its members, and not only approves but censors the conduct of its members. If the county medical society is satisfied that one of its members is so guilty of unprofessional conduct that he should be punished for the offense, then it is up to that county medical society to bring the offending member before the society to answer charges and receive such sentence as the majority of the members of the society may think indicated after the facts have been presented and properly analyzed.

AS will be noted in the treasurer's report published in this number of THE JOURNAL, the Indiana State Medical Association now has about ten thousand dollars in the treasury. By all that is good and holy let us not look upon this plethoric purse with covetous eyes if we have any impractical schemes which need funds in order to carry them to successful fruition. If we are going to appropriate any money for anything outside of the legitimate expenses of the Association why not give something to the Committee of Public Policy and Legislation with instructions to get busy promoting wise medical legislation in upholding our present standards of medical education and licensure. Furthermore, this same committee could with propriety start a campaign which would have as its object the education of the public concerning health matters, and to do this effectually would require some funds. In other words, the medical profession should resort to propaganda, and it will be necessary to do so if we are to offset the effects of the teaching of medical pretenders and quacks who today are spending a hundred dollars to our one dollar for accomplishing ends which are diametrically opposed to all that we teach and practice.

IT cannot be doubted that ignorant people get their medical knowledge from quacks. In its ultimate analysis this is due to failure on the part of the regular medical profession to give the public as much information as it should have concerning the nature, cause and treatment of disease. It is true that boards of health attempt to disseminate knowledge by means of leaflets, and pamphlets, but this does not answer the purpose. What we really need is more dissemination of knowledge through methods that will reach the people who should have the knowledge. Newspapers and other lay periodicals could do much toward educating the public but they cannot do this without being furnished with the proper material, which must come from educated medical men. The *Chicago Tribune*, through its column entitled "How to Keep Well", edited by Dr. W. A. Evans, perhaps has done more to put its readers in possession of good advice on medical subjects than any other single agency devoted to public health work. What a wonderful work could be accomplished if we could induce every newspaper in the country to have such a department as that mentioned and have the same edited by a recognized authority. Here is a chance for the American Medical Association to get busy, and as a suggestion we believe that it is not only possible but highly desirable to have health talks not only syndicated but guaranteed appearance in every newspaper of the country.

WE have been hearing much in the lay press concerning rejuvenation by testicular transplantation and occlusion of the seminal ducts. Probably there always will be a search for some agent which will revive the fading energies of

the human race, and for ages there has from time to time sprung up some presumably magic agent which is heralded as a rejuvenator, later to be proven worthless. As yet it has not been demonstrated that anything will renew sexual vigor which has been reduced as a result of natural processes. The fundamental error in the whole scheme of rejuvenation is the assumption that sexual vigor is dependent upon any one thing. As a matter of fact it is dependent upon a large number of functions operating coordinately with each other, and the effort to restore a single one of those functions without repairing all the others ends in failure. As has been aptly stated, the efforts to rejuvenate old men by the implantation of youthful testicular substances and thus perhaps stimulating only one of the links in the endocrine chain is a good deal like trying to strengthen a wornout chain by inserting one new link. A careful analysis of the cases in which rejuvenation is supposed to have occurred as a direct result of the employment of some of the methods recommended indicates that the questionable rejuvenation is purely psychic and shortlived. Probably through all the ages to come there will be those who will seek the Fountain of Youth, but like Ponce de Leon they will be doomed to disappointment.

IT is reported that Dr. Adolph Lorenz is to return to this country late this fall to resume his work of paying off the debt that he thinks he owes to the American people, by caring for some of the crippled children of this country. Of course Dr. Lorenz need not come to this country to find something to do, for there are plenty of crippled children in his own country requiring such attention as he can give, but in reality the parents of Austria's crippled children cannot pay for the services, and many of those in America for whom Dr. Lorenz renders services are able and do pay handsomely for the services. In fact it is stated on reliable authority that Dr. Lorenz is making a handsome income from his so-called payment of the debt of gratitude to America. However, an analysis of the matter leads us to believe that Lorenz' visit and the widespread newspaper publicity given his work has presented forcibly to the attention of the public at large the presence of large numbers of crippled children and the possibility of giving them relief. As the New York commissioner of health says, "In spite of the fact that the orthopedic hospitals and orthopedic surgeons of New York City enjoy world wide renown, the community has failed to make full use for their cripples of these advantages so easily and freely obtainable." The Lorenz visit has served to bring forth these little sufferers, and once they are located it is hoped that they may be brought to the attention of our surgeons who are as capable as Dr. Lorenz to take care of them.

As can be testified by the educational committee of the A. M. A. no little trouble has been experienced in making those in control of the Rockefeller Foundation understand the attitude of the medical profession toward medical education and the function which medical men should have. Any controversies that have arisen have been due largely to the fact that the Rockefeller Foundation is dominated by a lay element which either cannot or will not consider medical problems in a professional way. Just now the Michigan medical men are up in arms concerning the proposal of the Rockefeller Foundation to establish a separate school of nursing and to create a separate independent profession no longer subservient to the medical profession. The graduates from this school are to be classed as "super-nurses", and their activities are to be directed along the lines of preventive medicine, health clinics, prenatal clinics and public health work, with, as they state, the home as their field of activity. These activities they will engage in without the aid, advice or direction of doctor or the profession. Such a move would deprive nursing education of its most important contact with those whose years of experience qualify them to care for the sick. It also would deprive them of the training and contact which is absolutely necessary for the best results if the patient, the one most concerned, is to be benefited by the enterprise. As understood by some of the medical men of Michigan, the plan as proposed would have a tendency to make the nurses superior to the physician who is responsible for the treatment of the patient, and the views of the medical profession would have no weight in the training of nurses. It remains to be seen whether the University of Michigan, which has been flirting with various schemes that seem to be antagonistic to the highest type of medical education and practice, will "fall" for the plan offered by the Rockefeller Foundation. Perhaps the million dollar fund which accompanies the offer will have a determining voice in the matter.

DEATHS

MAURICE H. KREBS, M.D., of Huntington, died August 17 as the result of an acute attack of heart trouble, at the age of forty-four years. Dr. Krebs graduated from the Columbia University College of Physicians and Surgeons, New York, in 1900. He served in the Spanish-American and World wars, retiring from military service with the rank of lieutenant colonel. Dr. Krebs was a member of the Huntington County Medical Society, the Indiana State Medical Association, the American Medical Association, the Chicago Otolaryngological Society, the New York Ophthalmological Society and had recently been elected to the American College of Surgeons.

NEWS NOTES AND PERSONALS

Anything in the line of physicians' supplies or equipment may be obtained from advertisers in THE JOURNAL OF THE INDIANA STATE MEDICAL ASSOCIATION. Patronize these advertisers, for it means a continuance of their advertising patronage, and the latter means a larger and better Journal for you.

DR. J. V. REED and family of Indianapolis spent the month of July at Trout Lake, Wisconsin.

DR. EARLE H. MITCHELL has located at Maxwell, Indiana, for the practice of medicine and surgery.

DR. W. F. KING has been named secretary of the state board of health to succeed Dr. J. N. Hurty.

THE Henry County Medical Society held its annual picnic at the Westwood Country Club, Evansville, August 11.

DR. L. F. SWANK has opened an office for the general practice of medicine in the Haynes Building at Elkhart, Indiana.

ST. CLOUD, Minnesota, has been selected as the site for a new $1,000,000 hospital for service men of the World War.

THE Thirteenth District Medical Society held its annual outing September 1 at the Rochester Country Club on Lake Manitou.

DR. JOHN F. SOUTH, formerly of Louisville, Kentucky, has moved to Columbus, where he will take up the practice of medicine.

DR. S. J. STOTTLEMEYER has resumed his practice of medicine at Anderson after living in Texas for the last several months.

DR. JAMES WYNN announces the continuance of his office at 421 Hume-Mansur Building, Indianapolis, for the practice of internal medicine.

DR. E. VERNON HAHN has announced the continuance of his office at 421 Hume-Mansur Building, Indianapolis, for the practice of surgery.

THE Fountain-Warren County Medical Society held a meeting in Attica, August 3. A paper was presented by Dr. A. C. Arnett of Lafayette.

DR. S. R. BOGGESS, formerly of Lawrenceburg, Ky., has moved to Batesville, Indiana, where he will be associated in the practice of medicine with Dr. Carney.

THE State Medical Golf Association will meet and play on the Muncie Course on Wednesday morning, September 27, the first day of the medical meeting.

THE Wabash County Medical Society held a meeting August 15 at Wabash. Papers were presented by Dr. James Wilson, of Wabash, and Dr. F. F. Brown, of Lafontaine.

DR. E. B. ERSKINE has resigned his position as assistant surgeon at the State Soldiers' Home, Lafayette, to become lieutenant in the United States Navy. He has been assigned to the base hospital at Great Lakes.

THE Huntington County Medical Society held a meeting August 1 at the Huntington Country Club. Dr. J. M. Hicks presented a paper on "Diagnostic Value of Pain and Rests in Accidents and Surgical Diseases".

DR. JOSEPH W. SCHERECHEWSKY, assistant surgeon-general, U. S. Public Health Service, has been commissioned to conduct an investigation into the cause of cancer. Headquarters for the investigation will be established in Boston.

AFTER spending several years in Ecuador, South America, as chief surgeon for the South American Development Company, Dr. E. Ray Royer has returned to the United States and will take up the practice of medicine at North Salem, Indiana.

A SCHOOL for the blind, the first of its kind in Armenia, will be opened in Alexandropol by the Near East Relief under direction of Dr. R. T. Uhls, of Kansas City, Mo. The first pupils will be one hundred fifty Armenian war orphans, most of whom are victims of trachoma.

THE Eye Sight Conservation Council of America, New York City, is establishing a special mailing list for writers and lecturers interested in the subject of conservation of vision. Data and materials will be prepared and mailed periodically to persons whose names are on this mailing list.

A SCHOLARSHIP has been established at the Medical College of the State of South Carolina, Charleston, by the American Bronchoscopic Society in memory of the late Dr. Henry Lowndes Lynah. The dean of the medical school has been empowered to award the scholarship to a deserving student.

DRS. C. E. and CARL W. SAWYER have announced that Dr. Howard D. McIntyre and his wife, Dr. Aurelia P. McIntyre, are associated with them at the Sawyer Sanatorium, White

923 Cherokee Road **Louisville, Kentucky**

Oaks Farm, Marion, Ohio. The Sawyer Sanatorium is devoted solely to the treatment of nervous and mental diseases.

Two chairs in the University of Cincinnati College of Medicine were founded at a meeting of the board of directors in July, honoring John D. Rockefeller and Andrew Carnegie. The professorship in obstetrics will be known as the John D. Rockefeller Chair of Obstetrics and the professorship in biochemistry will be known as the Andrew Carnegie Chair of Biochemistry.

THE Tri-State District Medical Association will hold its annual meeting at Peoria, Illinois, October 30th, 31st, November 1st and 2nd. Papers will be presented by many of the most prominent doctors of the country. The program committee consists of Dr. Edward H. Ochsner, Chicago; Dr. Walter L. Bierring, Des Moines, Iowa; and Dr. George V. I. Brown, Milwaukee, Wis.

PROFESSOR SCHOEP in the bulletin of the Belgian Chemical Society, reports that the sample of minerals from the Congo yield 424 kg. of uranium and 139 mg. of radium to the ton. Two new kinds of minerals, extremely radioactive, have also been found. One of the minerals has been named "curite" and the other "kasolite" and their crystals are soluble in nitric acid, and the radium salt can be extracted from the fluid without passing through the usual calcination process.

ACCORDING to tables issued by the United States Department of Commerce, the longest lived people in the United States are the Kansans, the expectation of life at birth in Kansas being 59.73 for white males and 60.89 for white females. Wisconsin ranks next with 58.77 for white males and 60.70 for white females. For cities, Washington outranks all others with 53.93 years as the expectation of life for white males and 59.83 for white females. Pittsburgh comes at the foot of the list with 57.15 for white males and 50.42 for white females. Indiana, for males, is eighth in the list of states with 56.84, and seventeenth for females with 57.45.

IN addition to the articles enumerated in our letter of August 1st, the following articles were accepted during July: Intra Products Company—Ven Calcium Cacodylate Ampules-Ipco. Winthrop Chemical Company—Theocin.

During August the following articles have been accepted by the Council on Pharmacy and Chemistry for inclusion in New and Nonofficial Remedies: G. W. Carnrick Co.—Corpus Luteum-G. W. C. Co. Gradwohl Laboratories—Sterile Solution of Mercury Oxycyanide—Gradwohl. Ledelre Antitoxin Laboratories—Pollen Antigens-Lederle, Solution Epinephrine-Lederle. New York Intravenous Laboratory—Loeser's Intravenous Solution of Mercury Oxycyanide. Parke, Davis & Co.—Antipneumococcic Serum (Polyvalent). Winthrop Chemical Co.—Luminal Sodium Tablets 1½ grains.

CORRESPONDENCE

THE MAYO CLINIC AND NEWSPAPER ADVERTISING

Chicago, August 2, 1922.

To the Editor:

I have just read with great interest Dr. Reynard's article, "Shall We Advertise?", and your able editorial, "Unethical Newspaper Advertising," in your July issue, and find in both references to the Mayo Clinic.

Permit me to say, I was asked very recently to advertise the "Chicago Great Western Railway" schedule in Medical Journals with the purpose of advising physicians in different states—particularly Kansas, Missouri and Nebraska—how they might put patients on a sleeper at night and deliver them next morning in Rochester, Minnesota. The natural inference of course was that these patients were being sent to the Mayo Institute. But even the railroad authorities refused to have Mayo Clinic mentioned in their advertisements because they knew the Mayos objected to it.

How can physicians use the Mayo Clinic as an excuse for advertising when even railroad authorities know the Mayos decline to have their institution mentioned in general advertisements?

E. WRIGGINS.

Inconsistency?

Fort Wayne, August 10, 1922.

To the Editor:

The article in the July number of THE JOURNAL by E. G. Reynard, of Union City, against advertising, is peculiarly inopportune because of the fact that the current "American" contains a write-up of the Union City aggregation of celebrated specialists, with a life history of each, in which all medical society affiliations are listed and the military record of each emphasized. This material could only have been furnished by the doctors themselves and therefore it makes a travesty of the preachment you publish.

"Consistency, thou art a jewel."

Yours truly,

B. VAN SWERINGEN.

(Dr. Reynard is not a member of the advertising "aggregation" above mentioned, so it seems to us that there is nothing inconsistent in his preachment unless it can be proven that he himself is guilty of the acts he condemns.—Editor.)

Commendation.

To the Editor:

It affords me pleasure to compliment you upon the quality of THE JOURNAL OF THE INDIANA STATE MEDICAL ASSOCIATION. The original articles are of high grade, but it is in particular the editorials which makes me wish to shake your hand. Were more of the profession willing to fall in line with the ideals set forth in the editorials, I am sure the medical men of the state would occupy a vastly higher and more respectable plane.

Wishing you the success your standard merits, I am,

Respectfully,

E. C. DENNY, M.D.

STATUS OF THE INDIANA MEDICAL PROFESSION*

WM. R. DAVIDSON, M.D.

EVANSVILLE, INDIANA

The opportunity during the past year to come in touch with the thought of the profession in Indiana has been unusual. Personal contact and the exchange of letters have shown the interest which the physicians of Indiana are giving to the welfare of their calling. It has been, and should be, a revelation to the thoughtful that the physicians are looking ahead to their advancement. It is fitting that the questions most prominent throughout the state should be brought before this Association for its consideration and for its aid in solving the various problems.

The three points which stand out most clearly during the past year are (1) Education, (2) Professional Relations, (3) Practice of the Various Cults. Our members are keenly alive to these factors which govern them from day to day. Some questions, which it would seem should be regarded as belonging to the past, are still coming up in the life of our members, particularly of those in the smaller towns and rural districts.

(1) EDUCATION. I believe that there exists today as never before a genuine desire for the advancement of medical knowledge. The example set by one of our constituent societies, here in Muncie, has been a brilliant one for all medical organizations. A society in one of the medium-sized cities of our state has organized and carried through a program for the past few years which might well be found in the largest cities of the country. To them have come, from various parts of the country, leaders of professional thought and teaching, bringing modern ideas of diagnosis and treatment. Other societies over the state have made a beginning of similar courses of study. The interest in this during the past year brings up the question if there could not be arranged through the state secretary's office a plan of cooperation in this work. It might be possible to have a speaker spend two or three days or more at frequent times, and several societies working in consonance could profit by his presence.

Again, could it not be possible for the State University of Medicine to arrange for lecturers to make periodic tours of the state? The various colleges of the country conduct community courses in the towns in their neighborhood one afternoon a week for a certain number of weeks. This plan might be worked out in a medical way. It would be more adaptable perhaps to group the state as it is now divided and have district meetings. The course as carried out at Central Hospital this fall is such an example. One almost is envious of the opportunity the men in Indianapolis have of hearing the subject of neurology covered in this systematic method. If this plan, which has been followed so successfully in the past, could be adapted for other parts of Indiana, it would afford the profession an opportunity to be instructed in subjects which to so many are now abstruse. Could not other branches of medicine also, such as internal medicine, pediatrics (including infant feeding, or general dietetics) be carried throughout the state?

I believe that such problems should be worked out by the profession itself. Certainly they should receive the support of it. It is possible that such law as the Sheppard-Towner act was inspired and has been placed on the statute books because of the unconscious lack of interest of the medical profession in the care of the expectant mother.

The subject of pediatrics today is vastly different from that of fifteen or twenty years ago. The teaching is different, the thought is different, yet too many of our members turn to Borden's Evaporated Milk, to Horlick's Malted Milk, to Nestle's Food and other such foods as soon as it becomes necessary to institute artificial feeding. The subject of "summer complaint" or infectious diarrhea is no longer regarded as it was a few years ago, yet the great majority of practitioners cling to the old thoughts because they do not know the modern treatment.

It is through neglect of itself that the medical profession sees the invasion of its rights by

*President's address delivered before the Indiana State Medical Association, Muncie session, September, 1922.

the laity. If such an act as the Sheppard-Towner Act can be enforced, why not other provisions governing other phases of medical life? I regard the proper training of the physician as the one agency to overcome such conditions. It is disheartening to see libraries long out of date, and yet there are too many of these. How many times has this wail been sounded in the past twenty years, yet our members have written and spoken to me during this past year, and have desired that this be brought up in our state meeting for consideration.

(2) PROFESSIONAL RELATIONS. In the past fifteen years it has been a matter of interest to notice the rise and fall of certain of our constituent societies. As in the past, and as it will probably be in the future, the personal idea predominates, and not the professional. As the next session of the legislature approaches it will be necessary to secure the support of our members on certain measures, yet how many will continue to be Republicans or Democrats and not doctors. The provisions of the medical practice act apply to no party, yet men fail to help out by their letters, telegrams or personal word. Certain sections of the statute might well be strengthened. There will be great need for personal endeavor.

The constituent societies are urged to take more interest in their programs of professional relations. The faults of fee-cutting and low prices are surprisingly prevalent, and, as one of my correspondents stated, "the city men do not know how extensively this is done," neither are they concerned—they have their own problems, but they can aid by their influence.

(3) THE PRACTICE OF THE CULTS. There has been no question so widely discussed in person or letter during the past year as this one. Largely due to the advertising skill of one cult, there is great misunderstanding as to why it flourishes. I desire to make clear a few points in the development of these cults.

There are, all together, about thirteen or fourteen different recognized schools or cults of healing. We have seen the coming of the vitapaths, naturopaths, mechanopaths; we have witnessed the rapid rise of the chiropractor; we are now seeing the start in our state of the latest, the napropaths, and doubtless there will be many others. It is perhaps not known to many that recently in one of the counties of the state a prosecuting attorney obtained a grand jury indictment against three irregular practitioners, and at the trials, in spite of favorable instructions, the jury rendered a verdict of "not guilty". Regardless of the evidence and admissions the jury, by Indiana law the judge of the fact and the law, still rendered their verdict in favor of the defendants.

Now why is this? Why does the layman support the irregular practitioner? As a matter of fact he always has and always will. From the earliest days, there has been the antagonism between the recognized, regular physician and the irregular, supported and maintained by the public. It has always been a fact that the regular medical profession is built on a scientific education, a systematic structure, in orderly progress, of all the branches pertaining to a medical education. The cults represent a rebellion at this progress, making a short detour to get into the path of easily earned money.

Barnum said truly, "The public likes to be fooled". We realize this when we see in this day of progress people seeking a "faith-cure" doctor. During the thousands of years disease has been regarded as evil spirits, as the various "humours" which have entered the body. It is not surprising that the thin veneer of civilization still retains a part of the mysticism which pervades humanity. The conception of disease is one which each individual regards as in his own understanding; otherwise, why do we have the Christian Science movement? Later to counteract this, the Emmanuel school, which was to be a part of medicine to treat the neurotic by the power of thought; the various schools which teach that disease is due to the pressure of the vertebra out of alignment; to impingement on the nerves; or as the napropath now claims, to the fact that the "ligaments are too tight" making pressure on the nerves. The bonesetter adjusts; the chiropractor adjusts; the pilgrim goes to the various churches to receive a bath or the laying on of hands, and goes away "cured". Is it not a fact that any layman is ready to make a diagnosis or offer treatment, or urge a "change to a different doctor"? Perhaps this lack of faith in the medical profession has been developed by our own lack of complete attention. In fact, the desire to be sound and strong is the strongest feeling of the individual, and from that comes the groping and wandering in the effort to attain that desire. Lovett of Boston has lately, in a scholarly and fascinating article, traced the rise of quacking, myrical healing and medical cults; and Frothinghan, in the *Atlantic*, recently has discussed these various cults.

It is curious that with the advance of science we have, almost in our generation, seen the fall of a few branches of healing—homeopathy, eclectic medicine, osteopathy—all flourished, then subsided. Why? Because of education. As the newness passed away and they were judged by results it was seen that the basic principles had been ignored and as the education was broadened to meet the need, it approached that of the regular school. Even today the latest, osteopathy, has included in its instruction courses of study which were once derided, and we find that their schools are ranked with those Class C schools, according

to the American Medical Association classification. It would be interesting to trace still further the paths of the irregular cults, but time is limited.

There has been much criticism of the State Board of Examination that there has been no prosecution in an attempt to rid the state of these irregular cults. Is it possible to enforce a law if there is no public sentiment upholding it? In California there have been more convictions than in any other state, yet they still flourish. The whole problem resolves itself into one of education, both on the part of the physician and of the public. The strongest argument we have is that statement made "that scarcely any chiropractor could be found who was a high-school graduate". Publicity as to lack of education, both preliminary and professional, will accomplish far more than prosecution. This means that we must devote more time to calm discussion with the laity and show that salesmanship and advertising do not in themselves give cures. The general public does not understand, and many physicians also.

The law, as it stands today, discriminates in favor of no school; it states what must be the basis for one to engage in the healing art in this state. A license is not a recognition of a school; it is merely a permit to engage in healing, and each day that an irregular practitioner engages in his work he is violating that law. Public sentiment is not upholding this law, and is ever ready to view the medical profession with distrust if it attempts to enforce it.

There is need for us to show the laity what the healing art is; what disease is; how it acts; how it is relieved; and how the public suffers from lack of proper attention. The patient with carcinoma of the breast or of the uterus is adjusted until the disease has become inoperable; the patient with incipient tuberculosis is allowed to become bedfast before a true diagnosis is made—then, and only then, can a sentiment be created in that circle which demands proficiency.

I believe the time has come for this association to be more active in its work. The public is eager for knowledge along the lines of true medicine. Our guest, Dr. Evans, is today doing a splendid work, and presents the best thought in his daily columns. There are other writers who have their articles published by syndicates —yet they do not reach the mass of the people in our state. A systematic campaign can be put forth by speakers or by the press. Any work along this line should come from this association, through its secretary. When the Indiana State Medical Association created the office of Executive Secretary (which was later abolished) it had some indefinite idea of this kind. With the proper man working as an assistant to the secretary, I believe this idea can be developed until a real service can be given our citizens.

During the next few months our members will be called upon to give their services for the good of the profession. With the demands for licensing boards to lower the requirements of practice; with opportunity to strengthen the present law, I feel that our members should stand together, not as members of political parties, but as protectors of public health, and when called upon, lend their best work in selection of lawmakers who will aid medical progress.

THE TREATMENT OF CARCINOMA OF THE UTERINE CERVIX*

STANLEY A. CLARK, M.D.
SOUTH BEND

In a consideration of the treatment of carcinoma of the cervix, one enters at once into a realm of uncertainty and conflicting opinions. Where such doubt exists as to the proper course to take, it is well for one to collect a mass of testimony, and by analysis attempt to determine where the preponderance of evidence lies.

Carcinoma of the cervix is a very common neoplasm, and the larger clinics are able to present records of hundreds of cases, but the percentage of unquestioned cures is so small that one doubts the efficacy of treatment at all. This is in marked contrast to the palliative effects of treatment of this condition. The treatments which will be considered briefly in this paper are surgical removal, the so-called heat treatment, and radiation.

The surgical extirpation of carcinoma of the cervix has been extensively and more or less radically employed for the past forty years. Proceeding on the theory that cure could be obtained if complete extirpation were made, the thoroughness of the operation was extended until the operative mortality prohibited any further extension, and yet the percentage of cures from these radical operations remained discouragingly low. The literature in the past year contains few opinions favorable to the continuance of these radical operations. The most notable example of such an opinion is that of Farrar Cobb, who states that of 60 radical abdominal hysterectomies performed for moderately advanced cases of carcinoma of the cervix, there were at the end of five years a percentage of 57.1 cures. This percentage was obtained with a 11.6 percent operative mortality. Could such a percentage of cures be obtained by the majority of surgeons, certainly there would be no reason for accepting any other method of treatment which we have at hand today, but a note of pessimism is found constantly in the reports

*Presented before the Section on Surgery of the Indiana State Medical Association, Indianapolis Session, September, 1921.

of the greatest surgeons, and it is fair to assume that the results obtained by the average surgeon are much less satisfactory than those obtained by Cobb.

The use of heat in varying degrees by means of the cautery has likewise failed to enlist much support. It doubtless is of value, and it is probably more efficacious in connection with one of the other methods.

During the past five years the attention of the profession has been drawn more and more to the use of radium therapy notwithstanding the fact that the early results obtained were based almost exclusively upon the treatment of hopeless or inoperable cases. Encouraged by the marked regression in nearly all cases, even in those which were very advanced, the use of radiation has been extended to the more favorable types with a corresponding increase in the number of apparent cures. The reports from the larger clinics are so favorable for radiation that the question is now acute as to whether carcinoma of the cervix should be considered a surgical disease. This question applies likewise to the early cases as well as to those moderately advanced.

The low percentage of cures following operative removal must be due to failure of total extirpation of the primary growth, or to the fact that metastasis has occurred before the time of operation. The writer has found that metastasis occurs in some of these cases although clinically there is no reason to suspect such extension has taken place. This metastasis frequently occurs in the spine, the pubic bones, or in the femur, and if radiographs are made of these parts systematically, prognoses will be much more accurate and the course of treatment may be directed more intelligently. It is unfair to the patient to submit her to prolonged irradiation or to an exhausting radical operation for carcinoma of the cervix when at the same time she has carcinoma in some distant part.

It has been the custom of many surgeons to employ radium as an adjunct to operation, reasoning that the effect of the radium might in some way extend beyond the limits of even the most radical surgery. The writer believes there is no such middle ground, and that at least the majority of cases will fall into one class or the other; either surgical extirpation can be performed safely and completely, or the case is one for radiation. Pre-operative radiation with radium in the cervix is likely to be of little value for the reason that the destructive effect upon the cells is profoundly greatest in the tissues closest to the source of radiation. Hence, if the destructive effects be obtained in tissues remote, certainly the proximal cells will be destroyed; or if the proximal cells be not destroyed, certainly the remote structures will not be affected and the knife must in the end invade the affected area. The carcinomatous cervix is an ideal receptacle for the radium tubes or needles, its structures affording sufficient filtration to protect surrounding essential organs. For this reason postoperative radiation is much less effectual than primary radiation. The cautery, when used to destroy a large mass projecting from the cervix into the vagina and to produce a crater-like excavation of the carcinomatous cervix into which can be placed the radium, has been found to be very beneficial.

In mentioning the use of the cautery, let me refer to a statement made by A. J. Ochsner, in Boston last June. He said that while he had been using the actual cautery in cases of carcinoma of the cervix for many years, he had gradually lessened its use during the past four years since he began to have his cases of carcinoma of the uterus treated with radium, and that in the past year he had not operated upon a single case of carcinoma of the cervix. These patients had all been treated with radium. He stated that his reason for doing this was that he found many cases in which there was glandular involvement far beyond the reach of heat. In some cases that seemed incurable the patient remained well for many years, some as long as twenty years. He ascribed this to the fact that the carcinoma in the distant glands were destroyed by the natural ability of human tissues to destroy the cancer microbe. Ochsner also advised against the removal of portions of tissue for diagnostic purposes. He stated that a very high percentage of his cases so treated died of metastatic carcinoma. He thought that portions of carcinomatous tissue might be safely removed for examination by means of the electric cautery.

Ransohoff, who began the use of radium treatment of malignant tissues in 1914, presents the following comment in regard to the question as to whether the radium treatment should be preceded by curettage or by the cautery: "From our observation it would seem that the results were the same one way or the other; therefore, we have definitely given up both curettage and cauterization as preliminary to radium treatment, and now we depend entirely on the radium. If the cases were chosen with the same degree of care that they are chosen for operation, I feel confident that the percentage of cures would be very large. I do not hesitate to state that in my opinion radium treatment should entirely supplant operation, not only in the treatment of inoperable cases, but also in the treatment of operable cases of cancer of the cervix."

Pre-operative use of deep Roentgen radiation through several ports of entry should be encouraged, as this method of radiation attacks the periphery of the growth, rather than the central focus, and its use is not attended by the edematous changes which occur from 5 to

10 days after radiation, and by the extensive connective tissue formation at the site of operation, which occurs later when radium is used in the center of the growth. By modern methods a considerable dose of radiation can be obtained in all glandular structures within the pelvis. In this connection I wish to quote Levin, who has made an extensive study of the action of radium and the Roentgen rays on diseased lymphoid tissue. He states that the outstanding feature of his investigation consists in the fact which he brings forward, that in the diseases of the lymphoid tissue, radium and the Roentgen ray do not act merely as a local agent which reduces the size of a tumor or an organ, but produce a general effect upon the lymphoid system of the whole organism. It is impossible to assert at present with any amount of certainty what the mechanism of this influence is. Also I quote from an article by O. Frankl and I. Amreich, of Vienna, with reference to histological changes incident to radium and x-ray treatment of carcinoma; they summarize as follows: "There are distinct differences between the direct and indirect treatment. Carcinoma cells respond more quickly to the action of the x-ray than to radium and do not show the stage marked by the swelling of the cell body. These facts induce one to advise the use of the x-ray in treating the parimetrium and the glands, while the use of radium is preferable in the treatment of the carcinomatous cervix.

If one must operate, therefore let him precede the operation by the maximum dose of deep x-ray irradiation, and let him follow his operation by radium within the vaginal vault, and a second course of x-ray.

In speaking of the use of the x-ray, I do not refer to the haphazard exposure of the abdomen to an undetermined dosage but to the carefully measured dosage applied to all sides of the pelvis.

My own observation and personal experience has convinced me that the combined use of radium within the cervix and uterus and deep roentgenization from without offers the best hope to the average patient presenting herself to the surgeon for treatment of cancer of the cervix today.

A brief review of the literature of the past year seems to confirm this opinion. The results of the combined method thus far are far from ideal, but it is the best we have to offer.

DISCUSSION

DR. GRACE LINE HOMMAN (Laporte): I was very much interested in what Dr. Porter had to say yesterday—that he was going to ask the secretaries of the different counties to present a program on the cancer problem the first week in November. I am firmly convinced that the treatment of cancer of the cervix is really a problem of prophylaxis and education.

At the Mayo Clinic about 50 percent of cases when seen for the first time are inoperable, and in my series of cases this last year in Laporte, 79 percent have been inoperable, so you see what a slim chance the radiologists have of doing anything, even with radium.

I, for one, am trying to educate every woman who comes into the office for examination. We should take the time—and it takes time—to teach every woman that it is abnormal for her to bleed between periods, or excessively during menstruation; that with such symptoms she should always have an examination to determine if there is anything abnormal. I think every one of us can stop to do that much, and that would help a great deal in the education of the public in the prevention of cancer.

Another thing I think is important—that we consider lacerations of the cervix more seriously as etiologic factors. I think a great many more women should be operated to correct this condition, even though they are going through the child-bearing period. Some may take exception to this statement, but when cancer develops more often about the time of the menopause why wait until the woman has cancer before you correct her pathology?

I have had some interesting cases this last year. Three cases of carcinoma of the fundus, inoperable for various reasons, are doing well with radium treatments. Two of these patients have now gone over a year, the fundus is very small and there is no evidence of metastasis.

I visited Bailey's clinic in New York last spring and saw some wonderful cures. I was given the privilege of examining a number of the cases and was impressed by the excellent condition in which I found a great many of them. Usually Bailey gives but one treatment. He places radium within the cervix and at the same time rays for three hours the broad ligaments and the cervix—using his bomb, which contains a gram of radium. Then the patient is allowed to go home, and as a rule that is all the treatment the case needs. I think with the improved technique and the larger dosage which many men are giving today, we shall have very much better results in the future. There is no question that radium is a wonderful palliative agent. It checks hemorrhage and discharge, and often relieves pain. In most cases the patient gains in weight and is very much improved.

DR. GEORGE KOHLSTADT (Indianapolis): The main thing that appeals to me in this cancer of the cervix is the fact that most of them are inoperable when the doctor sees them and metastasis has occurred.

Radium has been perhaps unjustly criticized because it does not produce a cure; but on the other hand, you do offer these people relief from pain and from other symptoms, with a minimum amount of inconvenience, practically no shock, and that is a great thing. Without

that the patients could only go home and die. You can at least offer palliation, and perhaps cure The time is too short to say whether there have been any cures, but there are some very promising reports of patients who seemingly are in good health. I think the greatest recommendation for radium is the palliation it gives with the least amount of inconvenience.

DR. ALBERT M. COLE (Indianapolis): We have been having hopeful reports from many sources on the radium treatment of uterine cancer. I am especially interested in Dr. Clark's statement as to the advantages of the combined use of radium and the x-ray. I have been following this method and I believe our results are going to be better than by the use of radium alone. It is a matter largely of getting in the pelvis sufficient ray to destroy the cancer cells. Those cells, if any, lying beyond the influence of radium may be reached by the x-ray directed through the abdominal walls.

The Germans have been building x-ray machines giving an enormous output of voltage which generate rays nearly equal to the gamma rays of radium but in far greater quantities. By "cross firing" through the abdominal or chest walls they are able to reach internal cancer and profoundly influence it. They have reported some cures and some astonishing improvements. Lately these reports have been substantiated by American observers but sufficient time has not elapsed to make any positive statements. American made apparatus of similar design will soon be on the market.

Some hope may be entertained that in this new armanentarium we may reach and favorably influence internal cancer, not only of the pelvis but also of the abdomen and chest.

DR. T. C. KENNEDY (Indianapolis): We all know that the surgical treatment of carcinoma of the cervix has been very unsatisfactory.

Many surgeons are turning from surgery to radium even in the earlier cases. In a discussion of this subject before the session of the A. M. A. at Boston, Ochsner made the statement that he had not operated a case of cancer of the cervix this year, but had sent them all for radium treatment. Dr. John G. Clark, at the same meeting, said he felt convinced the time has about arrived when we shall cease to speak of any operable case of cancer of the cervix, but shall submit them all to irradiation. He says he is turning to surgery in such a small number of cases as to carry the statistics in this line almost to the vanishing point.

Laceration of the cervix, in my opinion, is not sufficient to produce cancer. There is something back of it, some lowering of the body resistance, that allows the malignant cell to grow. It is not sufficient to treat the cancer, but we must increase the efficiency of the defensive organs.

A thorough examination should be made. Frequently other organs may be involved. In our service at the Robert Long and Indianapolis City Hospitals, we have a standing order for a cystoscopic examination of the bladder to be made before sending any case of cancer of the cervix to the radium clinic for treatment.

In regard to the cure of cancer, we do not know how many we cure as it is impossible to trace many of them. From my seven years' experience with radium I am convinced that the results are far superior to any operative procedure that has ever been devised. The time has arrived when every case of cancer of the cervix at any stage should be treated with radium.

DR. O. E. SPURGEON (Muncie): I want to report two cases of cancer of the cervix that I think will be of some interest. One case was treated seven years ago by a large amount of radium. The treatment was given at three-month intervals, and she had four treatments. I report this case as of interest since she is absolutely well so far as we can tell, and I report it on account of the length of time since the treatment was begun. At the time of beginning the treatment the uterus was bound down, adherent over to the left side, and there was considerable of a mass, hard and indurated.

I also want to report another case which has also been treated now for four years. This case had applied to four surgeons for treatment and was refused. They all said she was absolutely hopeless and it would be unwise to attempt to operate. She had one application of radium, a large amount was used, and she has entirely recovered. The one dose is all she ever had, and so far as we can tell she is clinically well. This case was very far advanced. The induration was very extensive, the uterus was entirely immovable, and it seemed as though the carcinoma had invaded the bladder wall. Previous to the time she was treated the carcinoma had invaded the rectal wall and there was a rectal fistula. This still persists, but so far as we can tell the case has entirely recovered, leaving only the bad results of the rectal fistula.

DR. H. O. SHAFER (Rochester): It seems to me that if there is any question at all in our minds about whether radium will benefit a patient, we should leave it to the men who are giving radium, because if there is any question it is almost certain there will be a recurrence, and in the last two or three years I have seen enough to make me enthusiastic about radium. I do feel, however, that the cases that get an enormous dose of radium are benefited more than those who have a small dose, and perhaps a second and a third dose.

I have seen two or three cases in which it is almost miraculous what radium has done. I have seen the case which Dr. Spurgeon reported, this inoperable type that was given the

massive dose; and I have also seen one like his case two, inoperable cancer of the breast, and that case has cleaned up and the patient is apparently well. That is one hundred percent more than surgery could have offered them.

I hope cancer week will be taken seriously by every man in every county, and that a lot of these cases will come to us early enough so that radium can be given. I feel it is an uncontrovertible fact that in the treatment of carcinoma in conjunction with surgery radium should be used early and the treatment kept up.

DR. STANLEY A. CLARK (closing): I hardly felt that this section would be particularly interested in the question of technique, so I left that out of the paper. My experience has extended over about two years, although I have been watching radium for a longer time, particularly because my experience with surgery was so unsatisfactory and my colleagues said their experience was of the same character. I think we all agree that as these cases come into our offices it is almost useless to operate. We have a condition which we are pleased to call the pre-cancerous state of the cervix, in which we have been advising operation, and in the past we have operated a number of these, and in none of these which we operated did we find any cancer cells. I feel that in these cases the radium will give these patients as much protection from cancerous tissue as is necessary.

The question of whether this dosage shall be given in one large dose or in several smaller doses repeated is of course still unsettled. When they began the use of radium there was no guide. The dosage varied, and there were many unfortunate sequelæ, as fistula of the bladder, rectal fistula, and of course all these bad results were laid at the door of radium.

The histology of the changes which result after the use of radium or the x-ray in the treatment of cancer is somewhat enlightening. I mentioned the extreme edema that occurs in the tissues after radiation. Surgeons who have operated cases of carcinoma of the cervix know that eight days after the operation extensive edema is produced. It was at one time maintained at the Mayo Clinic that we should operate at that time. They found it undesirable and gave it up and began to operate later. But I feel that that whole theory is wrong. These cases that come to you are either surgical or they are non-surgical. If the lesion is small, if it is in the fundus, or if it is frankly very early, such a case is probably best treated surgically. But these are in the minority. The cases that have gone beyond this stage are not surgical and they never become surgical, for the reasons I have mentioned. If the radium has destroyed the metastasis in the glands, certainly it has destroyed the primary growth, so why cut into it? The curative effect is secured with the production of fibrosis, and in any extensive cancer process, no matter how much it is radiated, you are very apt to find and if you search patiently you will almost always find cancer cells in the fibrous tissue. Any trauma of this tissue, either surgical or accidental, may liberate these cells and the cancer thus made active. They will probably start in the end anyway; that is the reason we do not cure all of these cases.

DISTURBANCES OF CARBOHYDRATE METABOLISM*

J. H. WARVEL, M.D.
INDIANAPOLIS

It was the custom for many years to class every individual showing a glycosuria as a case of diabetes mellitus. The condition was supposed to be due to a disturbed function of the pancreas, which in turn was brought about by certain sclerotic changes in the organ. Most of the cases presented the classical symptoms of true diabetes, *i. e.*, thirst, polydipsia, polyphagia and polyuria, with loss of weight and strength. Occasionally, however, cases presented themselves with a glycosuria, but without these other well-known findings. These patients often presented marked evidence of pathological changes in organs other than the pancreas. These last two mentioned facts were possibly the most important points in bringing about a classification of the glycosurias, as nearly as possible, to the etiological factor or the concurring pathological conditions which the patient might present.

The physician sometimes encounters a case which upon a single examination of the urine may show sugar. Following examinations may show an absence of sugar. This glycosuria may be due to any one of the following:

1. A large ingestion of carbohydrates.
2. Excessive mental or physical strain.
3. A disturbance of any of the endocrine glands other than the pancreas, *i. e.*, thyroid, pituitary or adrenal.
4. Brain tumors or injuries.
5. Administration of certain drugs.
6. Renal diabetes.
7. Diabetes Mellitus.

Groups one and two are considered by some men to be physiological glycosuria. Groups three and four are glycosurias due to pathological conditions. Group six, the cause of renal diabetes, is unknown.

The physician occasionally encounters a case which cannot be classified in any of the seven types just mentioned. The patient is one who, during the course of a routine examination, is found to have sugar in his urine. He upon inquiry tells us that he has not ingested a large amount of carbohydrates; nor does he have the

(*) Presented before the Section on Medicine of the Indiana State Medical Association at the Muncie session, September, 1922.

classical symptoms of diabetes. He has presented himself to the physician with symptoms which are not at all akin to diabetes. Evidence of pathological changes in the endocrine glands cannot be demonstrated. The physician may find the patient to have a mild hyperglycemia at the same time the glycosuria is discovered. Subsequent examinations of the blood and urine may show them to be normal. This patient, if given a moderate amount of carbohydrate, may again show a waste of sugar in the urine. This type of individual has been termed by some men as a potential diabetic, and it is in regard to this class of patient that I wish to place the most emphasis in this paper. In order to do so I will give our findings in several different classes of glycosuria cases, for the purpose of comparing them with the potential diabetic.

Group 1 —Physiological Glycosuria. The following chart well illustrates a case of alimentary glycosuria. A medical student was chosen for this test. He was considered physically normal followning an examination by an internist. He was given 100 grams of glucose by mouth. His blood and urine were examined before this administration of sugar, and at one, two and three hours following this meal. The findings were as follows:

	Normal	1 hr.	2 hrs.	3 hrs.
Blood sugar.....	87 mgms.	163	115	76
Urine sugar.....	neg.	.2%	neg.	neg.

In this case the blood sugar increased from 87 milligrams per 100 C.c. to 163 milligrams in one hour after the glucose meal; at the same time a small amount of sugar was found in the urine. At the end of two hours the blood sugar has dropped to 115 milligrams, and the urine is sugar-free. In three hours the blood sugar is normal and glycosuria is absent. This is considered by most men as a normal sugar curve; still others claim a normal individual should not have a glycosuria following the administration of 100 grams of glucose per os. We have had several cases to show sugar, after this procedure, in whom no pathology could be determined.

2. Endocrine glycosuria. S. M., male, age 31 years; height 172 centimeters; weight, 59 kilograms. Patient entered the hospital for tonsillectomy. Chief complaint: frequent sore throat; pains in the joints. Family history: negative for tuberculosis, malignancy and diabetes. Personal history: Had measles and scarlet fever as a child; frequent tonsillitis; influenza a few months ago; no history of pneumonia or typhoid. Denies a history of neisserian or luetic infection. Noticed neck "getting larger" at eleven years of age. Present illness: Since dismissal from service has had repeated sore throat with pain in the joints, confined to bed on several occasions. Physical examination: Tonsils hypertrophied and crypts filled with debris. Remainder of examination of no relative value except for a markedly enlarged thyroid gland envolving both lobes and isthmus. Entire gland is perfectly smooth. Patient has no exophthalmus. Slight tremor is noticed. Pulse 78. Stellwag and Von Graefe both negative. Patient has not lost weight and says he is not nervous. Palpitation not noticed. The basal metabolic rate is plus 16%. This low rate was to be expected with a colloid goiter. Patient was given 1.5 grams of glucose per kilogram of body weight. The following chart shows his disturbance of carbohydrate metabolism.

	Normal	1 hr.	2 hrs.	3 hrs.
Blood sugar.....	80	285	227	72
Urine sugar.....	neg.	2.8%	2.2%	neg.

The blood sugar is still quite high at the end of the two hour period, and the glycosuria is still quite marked. This does not occur in a normal individual, for as already noted the blood sugar should drop almost to normal in one hour and is always within a few points of normal at the end of two hours. This quite well illustrates the usual findings in the cases showing an endocrine unbalance. It gives us an idea of the influence a disturbed function of one gland has upon others of the endocrine system.

3. Renal glycosuria. L. C., female, age 46 years. Admitted to the hospital September 15, 1921. Chief complaint: Nervousness, "stomach and bowel trouble." Family History: Father and mother died of tuberculosis; two sisters dead of tuberculosis; one daughter 19 years of age living and in good health; no history of malignancy or diabetes. Personal History: Usual diseases of childhood with good recovery; no other serious illnesses; always nervous and easily fatigued. Present illness: In March, 1921, had a chill, high fever and pain in left chest; pain "around kidneys," frequency of urination. Had chills two or three hours each day for over a week. These chills were followed by fever. Patient had nausea and vomiting. Great amount of gas in the stomach which was relieved by eating, also relieved by soda. Appetite good, always hungry. No loss of weight. No polydipsia. No polyuria. Patient voided 1500 to 2000 c.c. of urine for twenty-four hours. Physical examination: Nothing of relative value to the case was found in the physical examination. Blood examination: Hb. 79%; R. B. C. 4,768,000; W. B. C. 8,400; Polynuclears 67%; small mononuclears 20%; large mononuclears 13%. Wassermann negative. Blood uric acid 2.1 milligrams per 100 c.c. Blood sugar 74 milligrams per 100 c.c. Urine at this time contained .2% glucose. The following day the urine contained .32% glucose. Phenosulphonephthalein 38% and 12%, total 50%.

The specific gravity of the urine ranged from 1.003 to 1.020. The urine was negative for albumin and casts. 75 grams of glucose were given by mouth and the following curve obtained:

	Normal	1 hr.	2 hrs.	3 hrs.
Blood sugar	90	100	96	78
Urine sugar	.21%	.38%	.24%	.22%

This case shows a glycosuria with a normal blood sugar while fasting. One hour after the glucose administration, the blood sugar content is still normal while the urine sugar is slightly increased. At two and three hours the blood sugar is still lower and the glycosuria is slightly decreased. This type of case shows little difference in the sugar waste regardless of the carbohydrate intake. Glycosuria in the presence of a normal blood sugar is diagnostic of renal diabetes. Renal diabetes is a condition over which there is a great deal of discussion. Some clinicians even doubt its existence and consider it as a type of true diabetes. The underlying pathology of the condition is not well understood. Still every one must admit that the three classical symptoms of true diabetes are most often absent. We were unable to get a ureteral catheterization of this patient to determine as to whether or not the urine excreted from each kidney would show the presence of sugar.

4. True diabetes. Every clinician is quite well acquainted with the blood sugar findings in a case of true diabetes. Hyperglycemia is to be expected as long as glycosuria is present. In fact the blood sugar content is almost always above 160 milligrams per 100 c.c of blood while the patient is showing sugar in the urine. I do not believe a great deal of value is obtained from blood sugar determinations while the patient is wasting sugar in the urine. When once you have the patient's urine free from sugar such an estimation gives you an idea of the individual's tolerance, or the kidney threshold point. I know of several cases, while under treatment, the urine was rendered sugar-free, and the physician thought it well to increase the carbohydrate intake. In one case the blood sugar was still quite high, 280 milligrams per 100 c.c. This would surely contraindicate any increase of sugar in the diet. It means either that this patient has a decreased tolerance for sugars, or a kidney condition which has raised the threshold point.

Some clinicians make a glucose tolerance test as soon as their diabetics become sugar-free, with the idea of determining the individual's tolerance. I do not believe this to be a good policy. It simply overburdens an already overworked pancreas and little is to be gained in the end by such a procedure.

We find no constant relation between the blood sugar content and the amount of glucose in the urine. For example, a patient may have 6% of sugar in the urine, and only 250 milligrams in the blood; or 2% of sugar in the urine, 450 milligrams in the blood. The former mentioned type is the easier in our experience to free from sugar, but is more apt to have an early recurrence than the latter.

Blood sugar determinations are of great importance when the urine is sugar-free, for at this time they act as a guide to dietary regulation; and also give us some idea as to the effect of treatment. We cannot rely on blood sugar determinations alone because of the fact that each individual is a law unto himself as to his glucose tolerance and kidney threshold point.

Wilder classifies his true diabetics under five groups, according to the clinical and pathological conditions encountered. He also gives the mortality rates on each class. He made a study of 298 cases presenting themselves at the Mayo clinic from January, 1920 to September, 1921. His classification is as follows:

a. Acute diabetes, characterized by abrupt onset and gradually falling carbohydrate tolerance, loss of strength and weight. Nineteen percent of the cases were of this class—most of them young people, average age twenty years. Nearly 25 percent of the cases followed attacks of influenza. Fourteen of these cases died in the first year.

b. Vascular diabetes. These cases associated with hypertension or arterio-sclerosis or both, with or without renal complications; 30 percent of the cases were of this type. The onset is insidious. The course is chronic. Ten died in the first year.

c. Diabetes of obesity. Fifteen per cent of the cases in this class. No vascular or renal disease evident, neither could evidence of pancreatitis be determined. The disease in this class of patients tends to be mild. Acidosis was found to occur quite frequently in this group. Only two deaths reported in two years.

d. Interstitial pancreatitis. Only 53 or about 15% showed evidence of pancreatic involvement, either as determined at autopsy or suggested by cholecystitis or other inflammatory processes near the pancreas. Many of the cases operated on at the clinic for different conditions had small pieces of the pancreas removed for microscopic examinations. The course of the disease is chronic and easily controlled by dietetic measures, according to Wilder. Only five deaths were reported in the first year.

e. Miscellaneous persistent glycosurias. Under this heading he has 54 cases. Five had tumors of the pancreas, fifteen had glycosuria following hyperthyroidism, five had tumors of the brain, four were renal diabetics, one had

syphilis antedating the onset of diabetes. Twenty-four of the causes he did not classify.

Wilder states that not enough time has elapsed to give definite prognoses on each class of case presented. He thinks that at least five years should elapse before any definite conclusions can be drawn. Every clinician has possibly noted these various types of diabetics, and if he would so classify and later follow them, we could possibly make some deductions which would be of value in a prognostic way.

5. Potential diabetics. Under this heading I place the individuals, who are without the classical symptoms of diabetes. Allow me again to refer to the cardinal points in this type of case. Sugar is accidentally discovered in the urine during the course of a routine examination. They present themselves to the physician for some ailment which is not at all akin to diabetes. The physician upon finding this small amount of sugar in the urine makes repeated examinations at later dates and is unable to detect sugar. He often gives 50 to 100 grams of glucose, and sugar again appears in the urine. Blood sugar examinations made upon these patients often show a mild hyperglycemia, while at the same time glycosuria is absent. Blood examinations for non-protein nitrogen, urea, uric acid and creatinine made at the same time are found to be normal. This type of case if closely supervised as to diet may not at any later date show sugar in the urine. The same cases without dietary restrictions are quite apt to become true diabetics. The following cases will represent a few of this class of patients:

D. F., male; age 32 years; occupation, grocer. Chief complaint, nervousness, easily fatigued, rheumatism. Family history: Father and mother living and well; one sister and two brothers living and well. No history of tuberculosis or malignancy. No history of diabetes in family. Personal history, measles and mumps as a child, typhoid at 13 years; influenza 1917, followed by pleurisy; some joint pains since dismissal from the army. Present illness, entered the hospital September 6, 1920. Complains of tiring easily on exertion. Notices palpitation during slight exercise. Has chronic cough which he thinks is due to excessive smoking. Has had frequent pains in ankles and knee joints for past nine months. No fever at any time. Physical examination: Patient appears undernourished. Skin appears dry. Eye reflexes normal. No exophthalmus. Nasal passages appear normal. Tonsils enlarged and crypts filled with debris. Thyroid appears slightly enlarged in right lobe. Chest: Increased breast sounds over left apex, lungs otherwise normal. Heart normal in size, no murmur. Abdomen: No tenderness over gall-bladder, pancreas or McBurneys point. Extremities: Reflexes normal. Slight tenderness of knee joints when pressure is made. Pulse 76; Temperature 98.4; respiration 20. Urine examination, 9-7-1920—Sp.Gr. 1.022, Albumin-negative, Sugar-Neg. 9-8-1920—Sp.Gr. 1.026, Albumin-negative, Sugar-.6%. Blood count—Hb. 81%—R.B.C. 4,320,000—W. B. C. 8,600 Polys—78%; Small lymphocytes 16%, large lymphocytes 6%. Blood Wassermann—Two plus positive. Glucose tolerance test—9-14-1920.

Glucose tolerance—9-14-20:

	Normal	1 hour	2 hours	6½ hours
Blood sugar	98	110	155	not made
Urine sugar	Neg.	Neg.	.24%	.18%

9/18/20—Blood Sugar (fasting)—77 milligrams per 100 c.c.

9/20/20—Basal Metabolic Rate—Plus 6%.

This case shows a rise in the blood sugar content after the administration of glucose. It also shows a continued glycosuria as late as six and one-half hours after the glucose meal. This bespeaks a disturbance of carbohydrate metabolism. Some might class this patient as a renal diabetic because he shows sugar in the urine with only a slightly increased blood sugar. The patient only had sugar in the urine at one time before the tolerance tests were made. He was at this time on a regular diet and had not ingested any unusual amount of carbohydrate. This is the fact that directed our attention to him. He was dismissed from the hospital a few days after these examinations were made with instructions as to his carbohydrate feeding. The patient again entered the hospital Oct. 28, 1921. His complaint at this time was loss of weight, polydipsia, polyuria and marked weakness. His weight had fallen from 154 pounds in September, 1920, to 130 pounds at this date. Morning specimens of urine and those collected two hours after dinner were negative for sugar on October 29th and November 2nd. Patient was at this time on the usual soft diet as served in the hospital. On November 3, 1921, patient had .25% of sugar in the twenty-four hour specimen. Sugar could not be found on November 4th or 5th.

Glucose tolerance—October 31, 1921:

	Normal	1 hour	2 hours	3 hours	4 hours
Blood sugar	93	166	253	181	not made
Urine sugar	Neg.	.62%	1%	1.2%	1.5%

This shows a markedly decreased glucose tolerance to that obtained a year previously. This patient when first seen was possibly in a pre-diabetic condition. We do not believe his thyroid condition was active enough to cause his carbohydrate unbalance when he first came under our observation. His clinical symptoms and basal metabolic rate cause us to make this conclusion. When seen this last time his thyroid was more enlarged and his metabolic rate increased to plus 37%. It may be that the carbohydrate intolerance is primary in this case to the thyroid condition. The patient was last observed a few months ago. His thyroid condition appeared improved. He makes several tests of his urine each day and it remains sugar-free as long as he carefully observes his diet.

The three following cases we were not permitted to study with so much detail as they were out patients to the hospital and only came in for laboratory examinations:

Mr. C. D. Age 32 years; machinist; weight 168 pounds. Seen October 21, 1921. Six months previous to this date the patient had been to the Mayo clinic where he was diagnosed as a case of chronic appendicitis. He refused operation. While at the clinic, and on regular diet, sugar was found in his urine. The patient's father was a physician and instructed the son to make his own urine examinations for the detection of sugar. These were repeatedly negative except on one occasion. The patient was eating whatever food he liked, omitting sugars in excess. On the date seen by us his urine was sugar-free in both morning and 2:00 p. m. specimens. His twenty-four hour specimen was also negative for sugar. His blood sugar was 160 milligrams per 100 c.c. He was cautioned against eating so much cabohydrate, and he promised to limit himself more closely. January 30, 1922, his three urine specimens (twenty-four hour, morning and afternoon specimens) were sugar-free, and his blood sugar was 152 milligrams per 100 c.c. On March 31, 1922, his urine was still sugar-free and his blood sugar down to 100 milligrams. His diabetes is arrested. He was unquestionably a potential diabetic.

Mr. E. C. H. Age 52 years; traveling man; weight 154 pounds. While presenting himself to a physician for a physical examination for life insurance, sugar was found in his urine. On March 2, 1922, his blood sugar taken while fasting was 156 milligrams per 100 c.c. On March 4, 1922, his urine was sugar-free, examined after a heavy meal. The physician cautioned him against the too free ingestion of sugars. The patient had lost no weight, nor did he present the other symptoms of true diabetes. Several blood and urine examinations were made at later dates as follows:

	Blood Sugar	Urine Sugar (24 hr. specimen)
4-1-22	88 mgms.	Negative
5-6-22	84 mgms.	Negative
6-3-22	102 mgms.	Negative

This is another potential diabetic. By limiting his carbohydrate intake his pancreas, which has been overworked, has been allowed to recover its balance, and he will possibly be free from glycosuria, even when placed upon the amount of carbohydrate used by a normal individual.

W. D. A. Male; age 56 years; patient seen on May 26, 1922. This patient was sent to the laboratory for a complete blood chemistry examination and protein sensitization test. He had frequent urticaria and a peculiar skin eruption. His blood findings were as follows. Blood Urea-Nitrogen, 15.4 Milligrams per 100 c.c.; Blood Uric Acid, 2.4 Milligrams per 100 c.c.; Blood Creatinine, 1.6 Milligrams per 100 c.c.; Blood Sugar, 153.0 Milligrams per 100 c.c.; Blood Carbon-dioxide, 69 Volume percent. In this case we notice a rather marked retention of sugar with the products of nitrogen metabolism within normal. This point struck us rather forcibly as the patient had not taken any food for sixteen hours. A morning and twenty-four-hour specimen of urine was negative for sugar. Blood Wassermann was negative. The protein sensitization test showed the patient to react to every food containing a large amount of sugar. The patient was advised to limit himself on carbohydrates and those foods to which he reacted by the protein skin test. A few days later the patient visited a very good internist in Chicago. He was told that he had a "diabetic dermatitis." His carbohydrates were reduced in his diet and his urticaria and skin eruption have disappeared. This patient may be an arrested diabetic. I feel that he should also be classed as a potential diabetic.

CONCLUSIONS

1. Any individual showing sugar in the urine needs medical supervision. If it is a physiological glycosuria [illegible] itself. If from an endocrine condition it is not so apt to be serious in itself, and will disappear if the etiological factor can be relieved.

2. Individuals showing a persistent glycosuria may be either "renal diabetics" or true diabetics. The seriousness of "renal diabetes" is questionable, as these cases have not been studied over a long enough period of time. Diet does not influence the glycosuria in these cases.

3. Blood sugar determinations are of value in establishing the glucose tolerance of a patient, and in studying the influence of diet and medication when once you have the patient's urine free from sugar.

4. Quantitative sugar estimations of the urine are of value when made upon twenty-four hour specimens of urine.

5. True diabetics should be classified according to the etiological factor and the concurring pathological conditions. This would be of value in outlining treatment and also in a prognostic way.

6. Any individual showing an occasional positive test of sugar in the urine should have a blood sugar examination. In this way lowered glucose tolerance may be detected, and the physician has the opportunity to reduce the patient's carbohydrate ingestion. This may be the one

big factor in allowing an over-burdened pancreas to establish its balance, and in this way prevent a future case of diabetes mellitus.

DISCUSSION

DR. B. M. EDLAVITCH (Fort Wayne): We are just beginning to obtain laboratory information of real value in this particular field, and we are practically just beginning to get clearer ideas and a better understanding of some of the clinical problems bearing on carbohydrate metabolism. Therefore, any contribution that brings out original observations along this line is well worth while. The principal point Dr. Warvel brings out—the pre-diabetic stage—is not altogether new, but this is a new field, and such a paper as this serves to bring the subject before the profession at large and helps to bring home some of the information that every medical man should have.

While most of us will agree with the doctor in the main, there are some points that justify differences of opinion. In the case of the first student who was given 100 grams of glucose, Dr. Warvel at the end of one hour found 163 mgms. of blood sugar, with 2 percent of sugar in the urine. This he considers a normal sugar curve, but he admits that others claim there should not be a glycosuria after 100 grams of glucose by mouth. I confess that I hold the latter view. I believe that a person who has a normal carbohydrate tolerance and a normal carbohydrate metabolism will not show hyperglycemia under these conditions. But there is no unanimity of opinion on this question today, and so long as we do not know the fundamental processes that underlie this question there will be ample justification for such differences of opinion.

In the second case the doctor presents there are some diagnostic features that point to a hyperthyroid state, and, on the other hand, some clinical findings that point to colloid goitre. In the presence of the practically normal metabolic rate (plus 16), the diagnosis of colloid goitre was justifiable and undoubtedly correct, as against hyperthyroidism.

The essayist is right when he says that there is no constant relationship between the blood sugar content and the amount of sugar in the urine. Because of this fact it becomes of considerable importance to find out just what has happened in the blood with regard to sugar—just as important as with regard to sugar in the urine. In order to find out what progress a hyperglycemia patient is making it is important to follow the blood sugar content at frequent intervals in order not to have to rely upon the urine sugar findings alone. The most accurate way of following these cases would be by daily determination of the blood sugar.

The doctor's final conclusion is that any individual showing occasionally a positive test for sugar in the urine should have a blood sugar examination. A blood sugar examination alone is not enough. Such a patient should have repeated examinations for blood sugar, as well as for urine sugar, under different conditions, *e. g.*, after a full meal, after fasting, after a glucose meal, because only in that way can the physician finally come to a definite conclusion as to whether he is dealing with a case of prediabetes, or the so-called "potential diabetes".

DR. C. R. STRICKLAND (Indianapolis): We are distinctly indebted to Dr. Warvel for the presentation of this paper, because of the fact that quite recently diabetes has begun to come into its own for consideration and contemplation among physicians. Over 5,000 deaths occur from diabetes each year in the United States. That gives each of us a case now and then, and if we are careful in our examinations we will find many more cases as time goes on. Bringing in the carbohydrate metabolism makes the discussion of the paper extremely difficult because of the variety of things that enter into consideration.

Some years ago Allen said that there was no diabetes without pancreatic insufficiency. I think he has now partially taken that back. Diabetes is a complex, a condition rather than a disease, and the diabetic is an individual rather than the individual being a diabetic. We know that disturbances of the liver, the thyroid, the adrenals, and the autonomic nervous system will change the carbohydrate metabolism quite considerably. Postmortem reports covering 5,000 cases from Bellevue Hospital showed not many cases of pancreatic disturbance, although I believe it is not possible to have pancreatic disturbance carried so far that we would not sooner or later have carbohydrate disturbance. That means that we will have to contemplate our cases more intensively and not prescribe merely a low carbohydrate diet and let it go at that.

I agree with Dr. Edlavitch that in Dr. Warvel's case the observation might not have been accurate. I do not believe one reading is sufficient to predicate a decision as to what would be normal, any more than one reading of the metabolic rate would be enough.

I should like to emphasize one point brought out by Dr. Warvel, and that is the importance of studying the blood chemistry. I should not consider the determinations in a case of glucose metabolism complete until I had made a full blood chemistry study. We are not sure of the etiology of diabetes, although perhaps we are getting closer to it as time goes on. Possibly such things as depress pancreatic function or alter the glucose metabolism would affect the kidney function, in which case a study of

the blood chemistry would show a disturbance in kidney function.

I would not place much confidence in the blood Wassermann in diabetes. It is notoriously positive in hyperglycemia, and yet is not necessarily a syphilitic reaction. I am not sure that this is true, but it is an observation often made by myself and others.

Diabetes is on the increase. Whether Allen was right in saying that this is due to the growing tendency to replace alcohol with sugar and candy, I do not know; but the taking of sugars and candies in immoderate quantities for a time might depress the pancreatic function by exhaustion. We therefore will probably find more cases of diabetes coming on than we have had before.

That brings us to a consideration of what we call "potential" diabetes. Naturally we are not acquainted with the metabolic balance or chemical adjustment of every individual, and, since we know that present-day stress of living, particularly during postwar readjustment, is producing depressing influences on the metabolic balance of many individuals, we should most earnestly investigate every patient who shows sugar in the urine. He may have only a so-called physiological glycosuria, or he may be in one of the borderline states of what is rather properly termed "potential" diabetes. I do not believe that any man with sugar in the urine should feel free from the advice of his physician, or from diabetes, until it has been established over a long period of time that he is free of sugar in the urine. He should come in every few months for examination, in view of the fact that he may be a potential diabetic.

DR. J. T. BOWLES (Muncie): In a practice of sixty-three years I have met and treated many cases of diabetes mellitus. The treatment that I have always adopted has been this: an exclusive diet of green vegetables, milk in all its forms, cheese in all its forms, excluding meat absolutely, and also excluding the more powerful carbohydrates, potatoes and sugar. I have two cases under observation now in Muncie, extremely bad cases that would be pronounced hopeless by the majority of physicians. I was called in to one case when the body was covered with furuncles and the polyuria was extreme. I put this patient on green vegetables, cheese, milk and eggs. I also give her citrate of soda every three hours, with five drops of specific jaborandi every three hours. I have had this patient under observation for six weeks, and last Sunday morning she was able to get up and get breakfast.

In all cases where I find sugar in the urine I put them on this treatment, and nearly all of them have recovered and have died of some other disease. I do not remember treating a case that has died from diabetes.

DR. ALLEN HAMILTON (Fort Wayne): Both the essayist and Dr. Edlavitch spoke of the difference of opinion on blood sugar findings. There is a very marked difference in methods employed. If you follow Folin, then the results are very different from those obtained by the Benedict methods on the plasma. If the readings done by the essayist were done on the plasma, they were very low. If Folin's method was used, it was a practically normal case. There are very different results in the different methods, and the percentages are much higher in the Benedict. Folin has now changed his method so as to get higher results.

Dr. Warvel spoke of the special classification of fat cases. That only means that they may be mild cases. If the pancreas is damaged the breakdown is where the strain comes.

I think the speaker said Allen had retracted from his former position. If he has it is in such a fine degree that it is impossible to see the difference. One point Allen makes is that the seriousness in children may show a difference in function from that seen in adults. This is not seen in puppies experimentally, for they do not show this difference from adult dogs; but children may show a difference in function of the pancreas.

After you have diabetes established it makes a vast difference in the form of food which the patient is given as to whether the blood sugar will come down within a reasonable time or not. If they have overstepped their diet and have a hyperglycemia from taking carbohydrates, it will come down very easily, whereas it is very hard to get it down after fat. The present use of high fats is a return to the old Vienna teaching in this disease, but if you feed high fat you are going to get a hyperglycemia that is very difficult to get down. For a short time you can feed fat in high calories, but if it goes on for any length of time it will be difficult to bring down. After all, the feeding of diabetics is a matter of cutting down the total calories.

DR. CHARLES S. SELLERS (Hartford City): From the practical points brought out by the essayist it has been well worth our while to attempt to stop the indiscriminate diagnosing of diabetes by examination of the urine alone. It is a very serious matter to have an insurance examiner turn down an applicant for life insurance because sugar has been found in the urine. It not only has great influence on his obtaining further insurance, but is a considerable shock to the individual.

Diabetes mellitus, to be diagnosed correctly, must be studied over a long period of time. It must be remembered that diabetes is a general metabolic disturbance resulting in an individual intolerance to the carbohydrate group of foods, manifesting itself in a persistent hyperglycemia. It must be remembered also that in a normal

individual you do at times have a hyperglycemia which does not persist, but is influenced greatly by exercise and food.

I wish to place in these records a case of diabetes complicated by a lymphatic leukemia; or a lymphatic leukemia complicated by a diabetes mellitus. The diabetes was discovered about 18 months before the leukemia. Reginald Fitz of Boston reports one similar case, but was unable at that time to find other reported cases.

DR. C. F. VOYLES (Indianapolis): Before the advent of the Wassermann test a man giving no definite history of syphilis gave a history of a mild cerebral hemorrhage while yet a young man. His diabetes mellitus had resisted treatment. He made a nice recovery after I put him on mercury and potassium iodide.

About six years ago I had a case in which there was no history of lues, and a Wassermann test was a clear negative. This patient also had received other methods of treatment with no benefit, but he made a satisfactory recovery on anti-syphilitic treatment.

Personally, if I carry the responsibility of treating diabetes mellitus I shall bear in mind the possibility of lues as the etiologic factor.

DR. JOHN H. WARVEL (closing): I was not so much interested in the dietary treatment or the methods of making the blood sugar tests. The point I wished to emphasize was the early discovery of pre-diabetic conditions, as we feel that many a future case of true diabetes may be arrested.

I still believe that urine sugar estimations are equally as important as blood sugar determinations, especially if made by the method suggested by Folin and Berglund. By this sensitive test we find that the sugar overflow by the kidney is parallel to the blood sugar content. This avoids drawing a blood sample each day, and we find many patients resent this procedure.

CONSTRUCTIVE THINKING IN OUR MEDICAL ORGANIZATIONS.*

A. W. CHILDS, M.D.

MADISON, INDIANA

Ladies and Gentlemen, in calling to order this annual meeting of the Fourth District Medical Society, I wish first of all to welcome you most heartily and greet you in a true fraternal spirit. We may well congratulate ourselves on our commodious and beautiful meeting place, and on evidence already manifest of true and genuine hospitality. We are fortunate also in the work of our program committee, for as I glance over the program I note that it has not been necessary this year to go outside of the society for talent, as every feature of the program is the product of our own efforts. I do not wish to be understood as opposed to imported instruction, for often we get valuable service from the man from without our ranks, but I do wish to emphasize the psychological fact that expression is essential to strong impressions, and when we deprive our members of the opportunity of expression in our medical societies we are depriving them of an opportunity for growth, and we are weakening our own organization. The strongest local society in our district is the society whose members are ready at any time to prepare a paper for the local or district meeting, and the weakest society is the one suffering from a sort of "parasiteism" in which the most commonly expressed symptom is, "Let the other fellow do it."

The life of a society, the same as the life of an individual, is indicated by its aggressiveness, "something doing," "pushing forward," "making your influence felt," "co-operation," and "constructive thinking," and are applicable in the description of a live society, while on the other hand "lethargy," "inanition," "exhaustion," "incoherence" and "discord," are symptons of decline.

As individuals we cling to life as the dearest possession in the world. One of the richest men in the United States says, "that he would give ten million dollars to prolong his life ten years." How precious life is to all of us, and yet we do not appreciate it till it begins to recede, then we come to realize that we are getting out of life in proportion to what we put into it, for the world pays us in proportion to our efforts and in the coin we ask. The wealthy man gets his gold, but the man who asks for better things receives that which is more precious than gold.

The lower animals generally live from four to six times the length of their maturing period. Why should man decline in about twice the time it takes him to mature? No man or animal is old until he feels himself old. I once knew a horse which was younger at thirty than some other horses I have known at twelve. Man is not old until his interest in life is gone, and his spirit becomes aged and his heart unresponsive. Touching life at many points with a constructive and not destructive idea will keep him young in spirit. Any man who is out of touch with youth and the spirit of the times in which he lives, who is always living in the past and longing for the "good old days," and whose mind is constantly dwelling on his infirmities, is old, no matter what his years.

Now as to the application to our Medical Society, our organization is the means through which we should have the freest expression. Through it we should be able to say to the world the things we want said. Through it we should be able to control legislative bodies, and have laws enacted which will not only protect

(*) Presidential address, Fourth Councilor District Medical Society, presented at Milan, Indiana, May 16, '22, and referred to THE JOURNAL for publication.

us but the public as well. It should be the greatest possible factor in the promulgation of health ideas and high moral standards. In other words, we as a medical organization, district or local, should have a wonderful influence in moulding the public conscience along the lines of right living and good health. But do we say to the world the things we want said? How seldom do you hear of a medical organization recommending any constructive work for the good of the community? How seldom do you hear of even one medical man appearing before the school children of his community?

Do we control legislative bodies? The laws in our own state are such that men without education and without legal and professional standing come into our communities and under the stimulous of big advertising and quackery insult the medical profession and rob the people of their right to be treated by men who have more than a financial interest in them. And yet legislators say that the medical organization is strong enough to have anything it wants in the way of legislation if it but knew how to wield its power. Do we direct the public conscience along the lines of right living and public health? Here it requires only the effort. People old and young are glad to listen to the medical man whenever he is willing to talk. A campaign of health talks in the public schools would be well received by children, teachers and parents, and recommendations from our local societies for the betterment of health conditions would be constructive work and would rejuvenate our organizations.

The most appalling situation in our local societies is the lethargy on part of its members; a symptom of old age and decay. Every physician here knows how difficult it is to get a full attendance when a paper is to be read by a local member, or when some educational work is to be put on by the state organization—constructive work—not interested—sign of decay. If there should be a funeral of one of our members we would attend. We are still alive enough to show our respect to the dead. Should we announce a subject such as: "A Death Blow to the Chiropractor," we would have a turn out, for we are interested in this particular destructive process. If we announce the subject of "Fees" a good attendance is sure to follow, for we are still alive to the calls of the butcher, the baker, and the candle stick maker. But a constructive program, even though it promises to better our condition, receives little attention in our local societies.

A recent letter from one of our state medical officials, in reference to the matter of strengthening our Indiana Medical Practice Act, says: "This has been attempted at each recurring session of the legislature for the past sixteen years, but on account of the well organized opposition put up by chiropractors and the *lack of an organized effort on the part of the profession,* we have been unable to get by with anything proposed to amend the law by the law-abiding physicians of the state. It is a sad commentary upon the intelligence of the legislative branch of our government that it lends listening ears to the violators of the medical law. This can only be accounted for because of the lack of uniform action of the law-abiding physicians of the state." Here is the admission on the part of a medical man at the head of the procession that the illegal man is organized for constructive work, and the legal medical man is unorganized, which means destruction. Our organization is large and portly and it is time honored. Possibly we are suffering from an accumulation of adipose tissue, common to senility.

A state legislator in commenting on the statements of this letter says: "That it is not a sad comment on the intelligence of the legislative branch, for the legislator must consider all sides and it is his business to try to make adjustments between the opposing parties which will be satisfactory to all." He laments the fact that the medical society is so poorly organized and seemingly so little interested in what they want, while the opposing forces are martialed and trained like an army and have a definite point of attack. He says that when there is a bill before the legislative body that concerns the chiropractor and the M. D. a flood of letters from chiropractors all over the state come to their respective legislators urging them to favor their side of the question. While from the M. D.'s there come a very few.

Another situation which must be recognized is the fact that while the medical men have been sleeping the chiropractor has "adjusted" himself and his "adjustments" into the hearts of the people, and from this anchorage he will be hard to dislodge. Whether we like it or not we must stand by and watch our patients go to him for treatments, and sometimes we have to hear how they have been benefited. We say it is a sad comment on the intelligence of our patients, but often the best educated people are the ones who go, and they don't ask our advice, and some come away singing the praises of the chiropractor. A representative woman, of good degree of intelligence, said to me, "The chiropractor is delivering the goods." Another said, "I doctored so long with the M. D.'s, so I just decided to try the chiropractor, and he has helped me." Sometimes they say "he has done me no good," but which ever that may be, the fact is that we, because of our lethargy for the past sixteen years, to the strength of the Medical Practice Act, have allowed the chiropractor to come in and try his experiment and as a result he has

become established. Now, what is the situation? The chiropractor has a foot-hold. The medical man is fighting him personally, and thus helping to advertise him, but is indifferent to the legal control of his business. The chiropractor advertises, the medical man does not, and often fails in the application of the principals of good salesmanship. In the face of all of this, can we, simply because of our long standing, and time honored respectability, hope to hold the laurels? Can we dare to hope that the legislative bodies of to-day will frame up and hand us just the legal protection we want when we are not united on what we do want, and make no united effort to get anywhere?

But the chiropractor is not the only culprit. There are the traveling specialists who come into the community every few weeks, such as the Spanish Specialists, whose specialty seems to be all the diseases of men, women and children; also the street corner vendors, with their healing balms and concoctions, and many patent medicines, etc. All of these inroads into the field of medicine need consideration, but just what should be done in individual cases is not within the realm of this paper. I am simply trying to make a diagnosis and expect to leave the treatment to more experienced hands. However, I wish to refer to a few suggestions from a letter from W. S. Campbell, M. D., president of the Standard Laboratories, who was asked what to do about the traveling specialists referred to above. He mentions the Sullivan county close communion organization as one solution, also he says sometimes it is better to give the calf plenty of rope and allow it to hang itself. In his letter he emphasizes the fact that the object of any fight should be the protection of the people rather than damage done to the profession.

There seems to be no legal way to handle these and many other difficulties constantly coming before us, and since undoubtedly the medium of the law is the correct solution, better legislation is the thing for which we should strive. A get-together program should be inaugurated and promulgated throughout our district, and we should not cease in our efforts till we have every physician enlisted in his local society, and every society in the state working for the common good. Let us get together for better legislation and help to enact better laws for the protection of the people. Let us get together for better health, and a higher standard of morality in our community. Let us get together men, socially and spiritually, and learn to love each other more, eliminate our petty professional jealousies, and break down the factions that divide and weaken us. Let us get together on constructive work, realizing with Browning, "that progress is man's distinctive mark alone, not God's and not the beast's. God is, they are; man partially is, and wholly hopes to be."

CONGENITAL DISLOCATION OF THE HIP

Henry Bascom Thomas, Chicago (*Journal A. M. A.*, Feb. 4, 1922), reviews his results in the treatment of dislocated hips. In all, there were forty-four cases and fifty-six hips. Twenty of these cases, or twenty-six hips—the condition being bilateral in six cases—were those of patients 6 years of age or older. In this series, eighteen operations were done. Reduction was effected in five cases, in one of which the dislocation was bilateral. One hip was redislocated because of the development of trophic changes. Eleven hips (seven cases) were not treated because the prognosis was too unfavorable. One hip remained out, as attempts at manual reduction failed and the open method was not tried because the muscles were too tense. One hip is marginal. In another case the result is questionable. The results in seven cases are not yet known. In none of these cases was the machine or reducing table used. There were twenty-four cases of patients under 6 years of age. In six of these the dislocation was bilateral. Therefore, these cases included thirty hips. Forty operations were performed Fifteen hips were reduced with a fair to good anatomic result and good function. The parents were pleased. Three hips remained unreduced and the patients did not return after release from the cast. In two cases the dislocation recurred. One of these patients has a fairly good function. In two cases the result is questionable. The results in six cases are not yet known because only the index card was found. In one case of bilateral dislocation the anatomic results are perfect and function is good but the patient limps slightly when fatigued. The five cases in which the hip is still out, the two cases in which it is marginal, and the two cases in which the results are questionable should not be regarded as failures, perhaps, because, as the patients are still under 6 years of age, the prospect of a successful result in another attempt at reduction is at least fair.

It is urged that all those who have had experience in the treatment of congenital dislocation of the hip make a detailed report, thus aiding in establishing standards of management which cannot fail to improve our results.

SURGERY IN CARDIORENAL DISEASE

That longstanding focal infections play an important role in the production of cardiovascular renal disease is generally accepted throughout the medical profession. It follows that removal of such foci as a preventive measure is always indicated. Similarly the advisability of removing such primary foci as a curative measure in cases already established can scarcely be questioned—at least as a general working rule. On the other hand, cardiovascular renal disease once established is a progressive process independent of the primary focus of infection. Just as the chronic multiple arthritis which arises from long standing tonsillar infection soon reaches a point where the several infected joints may themselves act as "feeding foci" and the arthritis spread therefrom in spite of tonsillectomy, so it is with the degenerative process known as cardiorenal disease. Tonsillectomy in widespread chronic arthritis of tonsillar origin is still indicated, it is true, and usually proves of material benefit even in advanced cases. There is a point, however, at which such cases should not be operated merely because the general conflagration has dwarfed the importance of the initial blaze into insignificance. Cardiorenal disease analogously reaches a point in its development at which renal degeneration is beyond material benefit, regardless of operative procedures directed against the focus where the original infectious process arose. Such operative procedures are not productive of material benefit under such conditions, and because of the risk attendant upon all surgery in such cases are distinctly contra-indicated. The surgical risk itself is not the strongest contra-indication because it may fairly be argued that such condition will inevitably progress to a fatal issue unless "something is done". The most potent argument against surgery in advanced cardiorenal disease, regardless of the surgical objective, is that the inevitability of its fatal issue will not be altered one whit thereby. Repression is infinitely more difficult than "doing something", but in such cases is infinitely more advisable and somewhat less hazardous.

CANCER WEEK

The American Society for the Control of Cancer, stimulated by their experience last year, are going to put on another "Cancer Week" throughout the United States and Canada, November 12th to 18th, inclusive. All agencies are to be utilized in the endeavor to get their message to the people. Short talks will be given before lodges, clubs, churches, industrial bodies and at the theaters. At the latter places also moving pictures and legends instructive in character along this line will be shown.

The cancer mortality is appalling and is increasing. There are more deaths from cancer every year than occurred because of our two years' participation in the great war. The annual toll of destruction from cancer far exceeds that from many common diseases like typhoid, scarlet fever, diphtheria, etc. It causes one out of every ten deaths after the age of forty in this country. Among women of forty and over, one out of every eight deaths is due to cancer. It is estimated that we can save, through ten years' work in cancer education, thirty thousand lives annually in this country.

We hope to carry this cancer message to every community of five hundred and over in this state, but to do this we need the help of every doctor in Hoosierdom. Information, literature and speakers may be had by addressing either Miles F. Porter, Carroll Building, Fort Wayne, or T. C. Kennedy, Hume-Mansur Building, Indianapolis. The Society in this state also owns the films of the Reward of Courage, which is an interesting and beautiful picture and one which teaches a very important cancer lesson. The Society will be glad to loan these films to communities desiring them, without charge save for transportation.

PUBLIC HEALTH WORK AIDED BY FISH

As an indication of the valuable work being done by the Rockefeller Foundation it may be noted that as a result of the activities of the Foundation the yellow fever outbreak on the Pacific Coast of South America was checked through the discovery and use of fish to devour the eggs and larvae of the mosquito. The usual methods of preventing the breeding of mosquitos was ineffectual inasmuch as the people failed to carry out the well-known precautions. Efforts to keep water containers covered were equally unsuccessful. Finally it was found that by distributing fish, two to four small fish to a container holding ten to fifteen gallons of water, the problem was simplified by about 75 per cent, with a lower resulting mosquito index than had been possible to get in any other way. The

distribution of 750,000 fish conquered the epidemic.

It is interesting to note that in malaria control as well as in operation against yellow fever, fish are now playing a most important role. In the southern part of the United States fish are being extensively used to control the breeding of the malaria mosquito. In some localities, even though drainage and oiling is practiced, the employment of fish to destroy the mosquitos is the chief or even sole reliance. In a group of five counties in Alabama practically every farmer has convenient access to a minnow hatchery from which he is able to stock breeding places with fish as occasion arises. The city of Richmond, Virginia, has stocked all its fountains, reservoirs and lakes with minnows and has established hatcheries to furnish the fish free of charge to any communities in the state that want them.

An interesting phase of the work is indicated in the fact that in fighting yellow fever, malaria, hookworm and other diseases in communities where the people heretofore have been ignorant and lax in adopting measures for the prevention of disease, there has been stimulated a general interest in the promotion of public health, and now the health officers, public health nurses and medical men who are spreading public health propaganda are welcome.

A. M. A. TO COMBAT SOCIALISTIC MEDICINE

THE American Medical Association, the parent of all of the reputable medical societies in this country, failed to heed the handwriting on the wall concerning many uplift schemes that threaten the destruction of the medical profession as a profession until forced to do so by the great wave of opposition to the do-nothing policy which has prevailed for some years. Those men in the medical profession who have been asking that something be done to save the profession from State Medicine and a lot of other things that work to the profession's detriment were accredited with being alarmists and even disturbers of the quiet serenity of the great parent body that continued to slumber on under the guidance of a few leaders who, secure in their professional or economic berths, have been inclined to believe that every one else is as secure as they are. Fortunately the tide has changed and now the A. M. A. is inclined to listen to the warnings that have been freely given for several years but of which no heed was taken. Now the Association is inclined to get busy in an attempt to stem the tide of adverse public sentiment and even legislation which threatens to abolish private practice entirely through the advent of State Medicine of one form or another.

The ignorance of the public concerning medical questions, and ignorance that was perpetuated because of the silence of medical men who should have been moulding public opinion, is to be corrected through the medium of a medical journal for lay people to be published by the great American Medical Association. There also will be established in Washington a legislative bureau, in charge of capable representatives, for the distinct purpose of bringing pressure to bear for the securing of wise and beneficent medical legislation as well as preventing legislation that threatens to be vicious. This same bureau will keep the medical profession of the United States posted as to what Congress is considering in the way of medical or public health legislation. It is expected that the American Medical Association through a legislative committee also will keep in touch with legislative affairs in the several states and give aid and counsel to state medical associations in securing wise and beneficent state legislation or in preventing the passage of obnoxious medical laws.

This is something that should have been done long ago, but the short-sighted leaders of our medical profession evidently have considered that it was beneath their dignity to have anything to do with politics, though every one but the doctor knows that the only way to accomplish anything in the way of legislation is to get into politics and work the game just as other interests work it in order to secure the desired ends. It may offend the dignity of some doctor to ask him to take a hand in politics, but if he desires to save his profession and his own vocation he will have to get into politics or get a representative that will do it for him and do it well. Then there are uplift schemes, innocent appearing on the surface, which deserve to be "swatted" by the medical profession, and especially by the American Medical Association. These schemes are too numerous to mention, but in passing we may mention the Sheppard-Towner fiasco, the iniquities of foundation control of medical education and experimental medicine, the control of medical policies in hospitals and other public and semi-public institutions by lay persons or organizations, bureaucratic medicine, and lastly, the aggressiveness of public health officials in their efforts to usurp the place of the general practitioner of medicine. All of the Utopian but impractical schemes that we now are fighting mean, if they are adopted, that not only will the private practice of medicine be abolished but we will have bureaucratic medicine with all of its ills, and a distinct lowering of the standards which prevail at the present time through the loss of incentive for capable men to enter the medical profession.

The battles we are waging and will have to wage in the future do not wholly concern the

welfare of the physician himself, but have to do with the welfare of the sick and disabled people of this country who are suffering now from the effects of sordid greed and quackery. These ills from which the public suffers are brought about through the apathy and indifference of medical men who have failed utterly to educate the public along right lines concerning the privileges and restrictions which should encompass all that pertains to the healing art. We have been a long time waking up to the dangers that threaten and it is an encouraging sign of the times when the great American Medical Association takes cognizance of the situation and attempts to remedy evils by belated action.

SOCIALISTIC TENDENCIES IN MEDICINE

In recent years, under cover of promoting the welfare of society or of some part of it, James A. Gardner, Buffalo (*Journal A. M. A.*, Aug. 12, 1922), states that many so-called reforms have been inaugurated which, in reality, are little more than the outcome of the emotional desires of restless faddists or of the ideas of extreme and radical discontents. The contention is sane that all reforms of whatever nature should be made only after patient and scientific investigation of the causes and the cure of the evil sought to be corrected, and that the desire to bring about such reforms presupposes knowledge obtained by serious investigation and careful research, unhampered by emotion or prejudice. The field of medicine has been a fertile one for the agitator and the propagandist. Reformers and uplifters have been allowed to invade, unopposed, the practice of medicine and surgery, until the time has arrived for raising the danger signals. The peril of the situation becomes more urgent when it is realized that the public is being educated to believe that the socialization of the medical profession will bring higher standards of health. The fact is that, with the initiative and individuality of the physician removed, the profession will cease to attract to it men of energy, ability and ambition, who are now keeping American medicine in the front rank of intellectual and scientific achievement. Prevention and education need the aid of the government; but the state should not compete with individual skill and superior knowledge and efficiency in the care of those who have money to pay and so should not be treated at public expense. Public health is the musical instrument easiest for the welfare worker to play, and the softest chord is the venereal problem. It is not wise for a state to pauperize its people, nor is it fair to the medical profession to deprive it of its legitimate livelihood. The physician has always been too busy looking after the needs of his patients to give much time to his own interest. Unless he awakens to the drift of the tide, there will soon be little inducement for a young man of real ability to enter the medical profession. The field of social welfare or social reform has developed to such an extent in recent years that it is now a recognized profession, remunerative and popular. The solution of this problem is suggested by Gardner under three heads: (1) There should be a social service, ably trained to make real and thorough investigations and competent to distinguish between the needy poor and those possessing the ability to pay. (2) There should be an awakening of the medical profession to the realization that it is equally responsible for this pauperization. There should be censorship of the services of the physician by some responsible body like the county medical society, as has been done in contract practice, so that patients able to pay should not be cared for gratuitously. (3) There should be education of the public to an understanding that if the standards of medicine are lowered through the loss of impetus and initiative in the young physician, the public will be the chief sufferer.

AND NOW THEY SEEK AN ANTI-CORSET LAW

"The organization of an anti-corset society in Indianapolis, having for its purpose the passage of laws prohibiting the wearing of corsets, forces us to wonder if we are in for a prolonged period of damfoolery, with every harebrained idiot in the land sitting in judgment on the clothes we wear, and on all our personal habits. One day we are invited by one set of cheerful idiots to wax indignant because young girls do not wear corsets at a dance, and now to become outraged because they do. With these long-haired men and short-haired women undertaking to determine the dress of womankind, critically passing on the length of skirts and the fullness thereof, making a scandal out of the use of rouge and powder, inviting a cyclone of censure because of the awful discovery that a seventeen-year-old girl carried a little mirror in her bag, and now with the plan to make it criminal to wear a corset, it is about time that common sense steps in and prevents the making of a mockery of our laws. The next move will be to make it criminal to wear silk hose—because they are associated with vamps. There are all too many half-baked reformers in this country who will never be satisfied unless they convert the women into slovenly, slattern, sloppy things, and make life unspeakably drab for all of us."—*The Fort Wayne Journal-Gazette, August* 29, 1922.

THE SMALL INVESTOR

Not every doctor becomes an investor, but some do save money which they desire to put into an investment in the hope that it will bring

an income. Few if any doctors are what are known as large investors in the sense that they have large amounts to invest. The vast majority are what are known as small investors. It is the small investor, with the desire to reap large returns from his investment, who generally gets stung by the ever present stock salesman with his glib tongue and rosy promises of great returns from investment.

"That stock is not a good one for the small investor," said a man who knows a great deal about securities. Just why the man who was well informed about stock propositions gave this advice is well to consider. Buying stock is a form of spending money for a good or a bad thing, either in a gamble or a well protected business enterprise. It is not good business for the small investor to risk his hard earned money on a gamble. Of course he may win, but the laws of chance are against him. When it comes to taking chances, risk only the money you can afford to lose.

Of course stock salesmen will tell you that the only reason they are offering their proposition to the small investor is to keep the control of the company from going into the hands of two or three very wealthy men. That may or may not be true. The important thing for the small investor to consider is, "Is the proposition safe enough for me to place my money in it?" Highly speculative propositions are a good bit like betting on a horse race: Occasionally a hundred-to-one shot goes across and wins money for the one who takes a chance, but they are so rare that few people ever make any money on them.

The small investor wants to keep before him this thought, "Suppose I need this money next week, in two weeks, a month, or possibly a year from now, what can I get from this stock if I sell it?" The majority of these wonderful "ground-floor" propositions that high pressure stock salesmen unload on the average small investor have very little value when the buyer needs the money and has to sell. The small investor has to take the loss when he needs the money the most.

It is, therefore, better for the small investor to put his money into something safe and to build it up for the future than to be using his money buying stock of get-rich-quick schemes which amounts to about the same as using money in shooting craps to win a fortune.

If the stock you are offered is not well surrounded by safety, figure out how much you can afford to lose before you buy. Then put in it only the money you can afford to lose. Learn all you can about a stock before you buy, and obtain the desired information from your banker or from a reliable and well established bond house.

EDITORIAL NOTES

DEAR DOCTOR:

THE JOURNAL and the Cooperative Medical Advertising Bureau of Chicago maintain a Service Department to answer inquiries from you about pharmaceuticals, surgical instruments and other manufactured products, such as soaps, clothing, automobiles, etc., which you may need in your home, office, sanitarium or hospital.

We invite and urge you to use this Service.

It is absolutely FREE to you.

The Cooperative Bureau is equipped with catalogues and price lists of manufacturers, and can supply you information by return mail.

Perhaps you want a certain kind of instrument which is not advertised in THE JOURNAL, and do not know where to secure it; or do not know where to obtain some automobile supplies you need. This Service Bureau will give you the information.

Whenever possible, the goods will be advertised in our pages; but if they are not, we urge you to ask THE JOURNAL about them, or write direct to the Cooperative Medical Advertising Bureau, 535 N. Dearborn St., Chicago, Illinois.

We want THE JOURNAL to serve YOU.

For the good of the public it would be wise to have a special licensure for specialists and grant certificates for the practice of a specialty only when the applicant proves that he is properly qualified. This special proof should not be extended to anyone who has not been thoroughly educated in the specialty selected and who has not had special practice in a medical school or in special hospitals. In no other way can the public be protected from the horde of pseudo and half-baked specialists that now infest the country. So much poor work is being done in the name of surgery that unless it is checked the reputation for surgery in general will fall into disrepute.

WELCOME State Senator Dennis Fleming, of Georgia, to the company of super-regulators. He has introduced a bill which provides that "any and all married men who shall go fishing without the consent of their wives shall be guilty of a felony, and their sentence shall not be less than five or more than twenty years at hard labor." Since the ideal of an increasing number of Americans is a state in which all things are dealt with by law, from red neckties to double negatives, we might as well hurry the movement along and acquire a government under which all citizens are standardized according to size, color of eyes and general deportment—the nonconformists being chloroformed. Then we'll know at once whether life is worth living.—*Illinois Medical Journal*, September, 1922.

IF the plan of the Indiana State Medical Association to furnish automobile insurance to its members is carried out successfully as contemplated by the report of the committee presented at the Muncie session, the cost of automobile insurance to the doctors of Indiana will be reduced about seventy-five per cent. We always have contended that automobile insurance is a

system of highway robbery, and the profits derived from that class of business are enormous as attested by the financial report of a well established company. It certainly will mean something to the doctors of Indiana to carry automobile insurance for about one-quarter of what they are paying now and, accordingly, we are very much pleased to know that the plan as outlined at the Muncie session in all probability will be put into effect.

A LITTLE knowledge is a dangerous thing. This is exemplified in the advice and opinions expressed by school examiners who look wise and pass judgment concerning conditions that they know little about. School examiners will send notices to parents stating that a child is nearsighted when perhaps the trouble is far sightedness, or perhaps the child has no error at all, or may advise a tonsil and adenoid operation or some other attention that is not indicated, and a competent physician sometimes has great difficulty in convincing the parents that the advice given is incorrect or should not be taken too seriously. If the school nurses and other examiners not qualified to pass judgment upon the needs of children merely would send notices to the parents asking them to consult a physician, and leave the matter of diagnosis and treatment to the physician, much confusion and misunderstanding would be avoided.

AT the last or Muncie session of the Indiana State Medical Association a resolution was introduced calling upon the State to abolish salaries of medical men who act as employees of the State in teaching capacities while at the same time enjoying private practice in competition with other physicians. The House of Delegates very wisely referred this to a committee for investigation, with instructions that the committee shall meet with the board of trustees of the medical department of the State University and such other persons as required to furnish evidence, and obtain full information as to the management and policies of the medical department of the University and the hospital connected therewith. The whole idea of this plan is to make the medical profession of the state fully conversant with the manner in which the medical school and hospitals connected therewith are conducted, and to bring about a closer affiliation and harmony between the Indiana State Medical Association and the medical department of the University. This is a step in the right direction and ought to result in great good for all concerned.

THE House of Delegates, at the last session of the Indiana State Medical Association, took action on the feature of the Indiana Workmen's Compensation Act which fixes the liability for medical and surgical services in connection with accident cases to not exceed sixty days. Most of the accident insurance companies make it appear that they are responsible for thirty days only. As a matter of fact in accident cases the attending physician or surgeon should recover for *all* treatment and care necessary, no matter whether it is concluded within thirty days or ten times thirty days. The Compensation Board and the insurance companies know perfectly well that there are many accident cases in which the after care can not be concluded within either thirty or sixty days, and there is no just reason why the attending physician should be made the "goat" for the benefit of a grasping insurance company. The House of Delegates has asked that there be an amendment to the Indiana Workmen's Compensation Act so that all treatment and care necessary in accident cases shall be provided and paid for by the employers or by the accident insurance companies representing them.

TONSIL surgery is a great fad among practically all physicians of the present day, and it is unfortunate that such a very valuable measure in selected cases is shamefully abused in both conception and execution. Physicians without any training of any kind whatsoever are attempting to remove tonsils and adenoid tissue, with the very natural result of mutilating many throats to say nothing of performing the operation in instances where it is not indicated. The amusing feature of the proposition, and one that is making the public skeptical, is the fact that it is such a regular feature with some general physicians who are attempting tonsil surgery to advise a tonsil and adenoid operation in every child, that they frequently advise such operations when no tonsils are present, the child having had a tonsil operation done previously in a very skillful and efficient way. We have no fault to find with the men who attempt to do things for which they are qualified and trained, but it does seem inconsistent to talk about the incompetency of quacks and charlatans when our own brethren exhibit such a woeful lack of the training that they should have to carry on the work that they are attempting to do.

THERE are in round numbers 142,000 physicians, 43,000 dentists and 45,000 drug stores in the United States. In the latter instance there are probably three druggists to every drug store, making a total of 100,000 druggists. These professions if properly organized and working cohesively can be made the greatest factor for good in the country. No legislation inimical to the best interests of the public and the professions named could be placed on the statute books with this organization working coherently. Not a home in the state or nation that is

not reached by some doctor during the course of the year; perhaps not an individual in the nation who is not met face to face and engaged in personal conversation by one of the three professions in the course of the year.

What a power if organized would be the doctors, dentists and druggists of the United States in combating medicinizing socialization schemes, schemes for health centers, clinics, compensation laws, health insurance, Sheppard-Towner Maternity Acts and in heading off Federal interference in medical practice by such menaces as the regrettable maternity bill and the other fifty-seven varieties of attempts to bring about State Medicine.—*Illinois Medical Journal*, September, 1922.

EASY MONEY

In the course of our wide reading, for the benefit of JOURNAL subscribers, one of us found, in the *Police Gazette* of July 1st, the following advertisement which we have photographed:

ANYONE : : ANYWHERE

Men or Women

You Can Easily Learn to Be a Doctor

We give you easy lessons by mail and give you a beautiful Diploma. We teach you to treat all kinds of sickness. You can open a Doctor's Office in your own home and

EARN $5,000 YEARLY

Many Doctors earn $5000 a year and more; some upwards of $10,000 a year. What others are doing You should be able to do

A Diploma Gives You the Same Opportunity and is Evidence that You are Master of a Profession of Dignity, Prestige and Influence!

WE GIVE YOU EASY LESSONS BY MAIL

You can become a Doctor by only a little study in spare time at home

A Common School Education is all That is Necessary
If you desire to enter an uncrowded field.
If you want to enter this dignified paying profession.
If you want to achieve financial independence and social standing
Merely send us your name and address and we will send you full information by mail Free, with cost or obligation. For free information, address

University Advertising Department
2nd Floor, 4250 Cottage Grove Avenue
CHICAGO ILLINOIS

N. Y. State Journal of Medicine, August, 1922.

—*Illinois Medical Journal*, September, 1922.

SECRETARY COMBS reports that the attendance of registered members at the Muncie session was 522. By consulting the files of THE JOURNAL it was found that previous registrations were as follows: Indianapolis 1915, 646; Fort Wayne 1916, 381; Evansville 1917, 270; South Bend 1920, 425; Indianapolis 1921, 500. It will be seen that in point of size the Muncie session eclipsed any previous session held outside of Indianapolis, and the Association certainly made no mistake in accepting the invitation of the members of the Delaware-Blackford County Society to be their guest. There also were approximately 200 ladies in attendance at the meeting. The number of visiting ladies has been increasing of late years, and it behooves the local committees entertaining the State Association to make ample provision for the proper entertainment of them. One of the most unpleasant situations arising in connection with the annual sessions is the problem of holding the attendance for the Friday afternoon session. It was quite disappointing this year that no one of the three vice-presidents was in attendance Friday afternoon to preside over the meeting when the president was obliged to be absent. In the emergency, the secretary secured the services of President-elect Dr. Good, who efficiently occupied the chair. Vice-presidents are elected not only to honor prominent members of the profession and their constituent societies, but also for the purpose of having available at any time a presiding officer for the general meetings.

As an evidence of the trend of lay opinion, the *New York World* has the following to say concerning the chiropractic situation:

"Fair play to the public would require adequate education of chiropractors—for example, a regular medical course plus specialized postgraduate work expected of a specialist in other fields of medicine.

"In such a course many would-be chiropractors would come to the conclusion that manipulation of vertebræ is not a cure-all, whatever its possibilities.

"Fair play to the public demands that chiropractic processes should be used only by men who know thoroughly what they are doing and why. Both common sense and science deny that all ills are traceable to the spine.

"Fair play to the public demands a strict curb on a great mass of quackery masquerading under the name of chiropractic. Fair play to the public would send a substantial percentage of chiropractors either to school or to jail.

"Adequate education might develop some competent healers of a limited group of diseases from the crowd of incompetent meddlers. But, given education, it is probable most of them would cease to be chiropractors."

As the *Ohio State Medical Journal* well says, "If the public is genuinely concerned about the protection and preservation of its health, it eventually must demand of its law-making representatives that statutes be enacted which will require certain definite minimum standards for *all* who treat the sick in any manner whatever. These requirements might properly be set at two years' work in an approved college of arts and sciences followed by a four years' course in a standardized scientific school. It is a hopeful indication that the most clear thinking lay writers now realize that a thorough education in the fundamentals is essential in order that the public be protected from mercenary motives as well as

from ignorance. They see through the preposterous contention of the chiropractors who claim that 'diagnosis' is unnecessary."

General elections will be held next month. How many doctors have registered so they can vote and how many doctors will take the trouble to find out how their vote shall be cast in order to effect the greatest good for the medical profession as well as for the public? The average doctor bears the label of a political party, and he blindly follows the party irrespective of whether the candidates stand for right principles or not. We should not forget that the pseudo-medical cults not only have some of their own members running for the legislature but they are industriously working for other candidates who have made a pre-election pledge to help these cults. What has the regular medical profession done to find out how candidates for the legislature stand on important questions and how many doctors are taking the trouble to acquaint their friends and acquaintances with the facts? One of the leading chiropractors of Indiana, at the head of a chiropractic college, has served one term in the legislature and now is a candidate for a second term. He was placed on the ticket because the regular medical profession did nothing to prevent him from obtaining such position. He was elected once, and will be elected again because of the apathy and indifference of medical men. It is a reflection upon the regular medical profession. The pseudo-medical cults are organized, and to a man they put time, effort and money into a political campaign to further their interests. We are unorganized except for scientific purposes, and we either put no time, effort or money into efforts to uphold the principles we represent or we give such grudgingly and sparingly. We have no just cause for complaint when we are trampled upon. We get just what we deserve.

IN Michigan the battle wages merrily as to whether the University shall establish a separate department of nursing which shall be entirely independent of the medical profession. The *Journal of the Michigan State Medical Society* says that some of the self-appointed leaders in the nursing profession, in discussing the subject, have said, "We are not going to take orders from the doctors and henceforth we will perform our nursing service under our own direction and not under the direction of the doctor." As we understand the plan, which, by the way, has been proposed by the Rockefeller Foundation with a one million dollar endowment as the bait to bring about acceptance, the University is to have a department of nursing which is just as distinct a department as is the department of medicine or law, and it is to operate independent of any other department. The final product turned out by this department is to be a "super-nurse," or one who is supposed to possess knowledge greatly in excess of the knowledge possessed by the ordinary trained nurse who has had the advantage of contact with patients and members of the medical profession, though the super-nurse is not required to have any such fundamental knowledge.

As has so well been stated by leading medical men and medical publications in this country, there is little need for "super-nurses," and certainly no need for the fifty thousand proposed by the Rockefeller Foundation. We already have enough highly trained nurses to meet all of the requirements imposed by the limited amount of technical work which they are prepared to do, but we are short of practical nurses, or the kind of nurses that are of real service in the sick room, whether the sick room be in hospital or home. If the directors of the Rockefeller Foundation desire to do something worth while for suffering humanity, and along this line contemplate dabbling with the question of educating the nurse, we suggest that efforts be made to increase the number of practical nurses by several hundred thousand and thus give the sick or those that need the nurses a chance.

DEATHS

AUGUSTA STONE, wife of Dr. C. E. Stone, of Vincennes, died August 15.

JOSEPH C. PURDY, M. D., of Terhune, died August 15 at the age of sixty-eight years.

STEPHEN M. BENNETT, M. D., of New Goshen, died September 2, at the age of seventy-five years. Dr. Bennett graduated from the Eclectic Medical College of Cincinnati in 1873.

DAVID R. CARTER, M. D., of Epsom, died September 4 at the age of seventy-four years. Dr. Carter graduated from the Emory University School of Medicine, Atlanta, Georgia, in 1883.

OLIVER S. COFFIN, M. D., died at his home in Alexandria, September 5. Dr. Coffin was eighty-one years of age. He graduated from the Indiana Eclectic Medical College, Indianapolis, in 1888.

JAMES G. WEBSTER, M. D., of Colfax, died September 9 at the age of 93 years. Dr. Webster was born in England and came to this country at the age of fourteen years. He graduated from the New York University Medical College in 1864.

J. T. TRESIDDER, M. D., of Tipton, died August 28, as the result of tuberculosis, aged fifty-nine years. He graduated from the St. Louis Hygienic College of Physicians and Surgeons in 1890. Dr. Tresidder was a member of the Tipton County Medical Society, the Indiana State Medical Association and the American Medical Association.

JOHN H. BULL, M. D., of Indianapolis, died September 17 in a sanatorium at Battle Creek, Michigan. Dr. Bull was forty-five years of age. He graduated from the Medical College of Indiana, Indianapolis, in 1903, and held membership in the Marion County Medical Society, the Indiana State Medical Association and was a Fellow in the American Medical Association.

E. M. HOOVER, M. D., Elkhart, died August 25, as the result of an apoplectic stroke. Dr. Hoover was fifty-two years of age. He graduated from the University of Illinois College of Medicine, Chicago, in 1906, and was a member of the Bartholomew County Medical Society, the Indiana State Medical Association and was a Fellow in the American Medical Association.

NEWS NOTES AND PERSONALS

Anything in the line of physicians' supplies or equipment may be obtained from advertisers in THE JOURNAL OF THE INDIANA STATE MEDICAL ASSOCIATION. Patronize these advertisers, for it means a continuance of their advertising patronage, and the latter means a larger and better Journal for you.

THE Huntington County Medical Society held a meeting at Huntington, September 5. Dr. R. S. Galbreath presented a paper.

THE Sheppard-Towner Maternity Act has been rejected by the governor of Maine. His rejection holds good at least until the next legislature convenes.

DR. W. C. LANDIS has been appointed director of the Child Welfare committee of Elkhart League of Women Voters to succeed the late Dr. E. M. Hoover.

THE Wabash and Grant County Medical Societies held a joint meeting at Lafontaine, September 14. Dr. Herman Kretschner, of Chicago, presented a paper.

THE Kosciusko County Medical Society held a meeting August 28, at Leesburg. Dr. Paul A. Garber, of Sidney, presented a paper on "Life Insurance Examination."

RADIO medical service has been established by the United Fruit Company whereby their ships at sea without physicians may obtain advice by radio concerning the treatment of sick.

THE Sullivan County Medical Society held a meeting at Carlisle, September 13. A paper on "Tuberculin and Vaccines in the Treatment of Tuberculosis," was presented by Dr. G. C. Johnson, of Evansville.

THE Howard County Medical Society held a meeting at Kokomo, September 1. Following a dinner, Dr. B. R. Kirklin, of Muncie, presented a paper, the subject being "Pathological Conditions of the Gall Bladder."

DR. R. H. BRAUNLIN, of Marion, has purchased the office equipment and office of the late Dr. M. H. Krebs, at Huntington, and will take up the special practice of the eye, ear, nose and throat at that place.

THE Thirteenth District Medical Society held a meeting at Rochester, September 1. Dr. H. O. Shafer, of Rochester, was elected president of the society; Dr. J. N. Kelly, of Westville, vice-president, and Dr. J. A. Work, of Elkhart, secretary-treasurer.

DR. STEPHEN SMITH, of New York, died August 26, at the age of 99 years and 6 months. Dr. Smith was joint editor of the New York Journal of Medicine and editor of the American Medical Times. He was the author of several books and was a member of the Council of Hygiene of New York City, the investigations of which led to the creation of the Metropolitan Board of Health. He was instigator and first president of the American Public Health Association.

SHOULD the bill introduced by Representative Sproul be enacted a law, a reward of one million dollars is to be offered by the United States government for a successful cure of tuberculosis, cancer, paralysis, epilepsy or dementia praecox. The provisions of the bill call for the payment of the reward in ten annual installments to be made by a board consisting of the surgeon generals of the Army, Navy and U. S. Public Health Service, who would be called upon to investigate claims for any such discovery.

THE United States Civil Service Commission announces an open competitive examination for laboratory aid in bacteriology on November 8, 1922. Vacancies in the Bureau of Animal Industry, Department of Agriculture, for duty at Denver, Colo., at $900 a year, and vacancies in positions requiring similar qualifications in Washington, D. C., and elsewhere at this or higher or lower salaries, will be filled from this examination. Applicants should at once apply

for Form 1312, stating the title of the examination desired, to the Civil Service Commission, Washington, D. C., or to the Secretary of the United States Civil Service Board.

THE Seventh District Medical Society will hold its annual meeting at Indianapolis on October 26, at the Indiana Dental College. The following program has been arranged:

Afternoon

1. President's address.....Dr. R. C. Ottinger
2. Syphilis versus Carcinoma of the Cervix Uteri.....Dr. A. S. Jaeger, Indianapolis
3. Obstetrics as Practiced in the Country.. .....Dr. O. T. Scamahorn, Pittsboro
4. Digitalis Therapy ....Dr. Edgar F. Kiser, Indianapolis

Evening

7:00 p. m.—Dinner at Columbia Club.

1. Functional Nervous Disorders of the Chronic Invalid" ....Dr. Hugh T. Patrick, Chicago

---

ALEXANDER RIGHTER CRAIG, M.D., Secretary of the American Medical Association since 1911, died September 2, at the age of 54 years. He was a graduate of the Franklin and Marshall College, Pennsylvania, and of the medical department of the University of Pennsylvania. He was granted honorary degree of Doctor of Science by Franklin and Marshall College. Dr. Craig served Pennsylvania continuously in the House of Delegates from 1903 to 1910. Since 1911 Dr. Craig has devoted his entire time to the work of the American Medical Association. He was a member of the American Academy of Medicine and president in 1912, and a member of the American Academy of Ophthalmology and Otolaryngology. Dr. Craig was active in religious and social work. Death occurred while on his vacation trip at Port Deposit, Maryland, and was the result of uremic poisoning.

IN addition to the articles enumerated in our September Journal, the following articles were accepted during August for inclusion in New and Nonofficial Remedies:

H. K. Mulford Company:
- Mercurialized Serum No. 2—Mulford;
- Mercuric Succinimide Hypodermic Tablets No. 50.

Parke, Davis and Company:
- Adrenalin and Cocaine Tablets Rx B;
- Adrenalin Tablets No. 2;
- Bromotone Capsules, 5 grains;
- Tuberculin (old) and Control for the Von Pirquet Test;
- Tuberculin Ointment for the Moro Test.

During September the following articles have been accepted by the Council on Pharmacy and Chemistry for inclusion in New and Nonofficial Remedies:

H. A. Metz Laboratories:
- Novocain and L-Suprarenin Tablets "H";
- Novocain Solution, 1 per cent;
- Novocain Base;
- Novocain Nitrate;
- Pyramidon Tablets.

United States Radium Corporation:
- Ampules Radium Chloride 2 Cc-U.S. Radium Corp. (Radium element, 5 micrograms);
- Ampules Radium Chloride 2 Cc-U.S. Radium Corp. (Radium Element, 10 micrograms);
- Ampules Radium Chloride 2 Cc-U. S. Radium Corp. (Radium Element, 25 micrograms).

Winthrop Chemical Company:
- Fereo-Sajodin.

INDIANA STATE MEDICAL ASSOCIATION

Muncie Session

September 27-29, Inclusive, 1922

HOUSE OF DELEGATES

FIRST MEETING

The House of Delegates met in the Grill Room of the Hotel Roberts, Muncie, at seven p. m. September 27, 1922, the president, Dr. W. R. Davidson of Evansville, presiding.

Roll-call of delegates.

Moved by Dr. George R. Daniels that the minutes as printed in THE JOURNAL be adopted. Motion seconded and carried.

Moved by Dr. George R. Daniels that the report of the secretary-treasurer as printed in THE JOURNAL be adopted. Motion seconded and carried.

Dr. James N. McCoy, Vincennes, chairman of the Committee on Automobile Insurance, made the following report, and moved its adoption. Motion seconded.

REPORT OF COMMITTEE ON AUTOMOBILE INSURANCE

House of Delegates,
Gentlemen:—

This Committee has proceeded with its work on the basic idea that a member of the State Medical Association is, from the nature of his work and his character as a member of a reputable profession, a preferred

risk for automobile insurance. The rates among the standard companies have gone to practically prohibitive figures for the doctor, as well as every other honest policy holder, because heretofore with every concern writing automobile insurance the doctor and other reputable automobile drivers have been insured at an even rate with reckless and criminal drivers. The Committee has, therefore, sought to obtain automobile insurance for the members of this association at rates which they believe proportionate to the moral hazard and actual risk of the insurance.

Your Committee has considered and investigated several procedures as follows, to-wit:

1. Insurance of the members of this Association with standard stock companies. This was found impossible because the standard companies are based on the maintenance of local and general agencies, which agents receive one-half of the premium written and the representatives of the standard companies whom we interviewed believed this would disorganize the agency force. And they gave us the further objections that automobile insurance at the best was not desirable and two of these standard stock companies stated to the Committee that they were contemplating retiring from this field of insurance. The fact is that the rates charged by this class of insurance companies are practically prohibitive.

2. The organization of a stock company or a reciprocal organization within and for the membership of this Association. It was found by consulting legal authority that the provisions of the Indiana statutes made this difficult and for the time being impossible. The first essential to the formation of a stock company would be the sale of $50,000 worth of stock. The first essential to the formation of a reciprocal association would be to deposit with the Auditor of State, securities in the amount of $25,000, together with 250 policies written on automobiles. Neither of the above procedures was deemed advisable, by reason of lack of time and the lack of authority of the State Medical Association to proceed. It was believed that it would be very difficult to do either of the above, even though no obstruction existed.

3. The execution of a contract between the State Medical Association and some reputable reciprocal organization, whereby the said reciprocal organization, in consideration of the large volume of business to be obtained, and by reason of the fact that the members of the State Medical Association constitute preferred risks for automobile insurance, would write individual policies for the members of the State Medical Association through the offices of the Secretaries of the various County Medical Societies at a premium rate which would be practicable for the said reciprocal organization and desirable to the members of the State Medical Association. The members of your Committee, before proceeding further toward the execution of a contract with a reciprocal organization, believed it necessary to inform themselves authoritatively on the legal phases of automobile insurance in general and as to the rights and liabilities of a policy holder dealing with a reciprocal organization, in particular. The legal firm of Emison & Hoover, a firm composed of reputable and dependable lawyers, was therefore employed to give a legal opinion to the Committee, covering the entire subject of automobile insurance in general and the rights and liabilities of the holder of a policy from a reciprocal organization in particular. The legal opinion of the said firm of Emison & Hoover is herewith submitted in full.

Dr. J. N. McCoy, August 8, 1922.
Vincennes, Indiana.

Individuals, partnerships and corporations of this state may exchange reciprocal or inter-insurance contracts with each other, providing indemnity among themselves from any loss which may be insured against relating to all classes of automobile insurance. The above mentioned parties are hereinafter designated "subscribers."

Such contracts may be executed by an attorney, or other representative designated attorney, duly authorized and acting for such subscribers. They may designate where the attorney's office is to be.

The subscribers through their attorney shall file with the Auditor of the State a verified declaration, setting forth:

(a) Name adopted by such subscribers.
(b) Kind or kinds of insurance to be exchanged.
(c) A copy of the form of policy contract.
(d) A copy of the form of the power of attorney.
(e) Location of office issuing such contracts.
(f) Bona fide applications of 250 separate risks, aggregating not less than $1,500,000.
(g) That such attorney has possession of assets for payment of losses—according to requirements hereinafter stated.
(h) A financial statement under oath in form prescribed for annual statement.
(i) An instrument authorizing service of process.

At the same time, the attorney shall also file with the Auditor of State an instrument executed by him for said subscribers, conditioned that upon Certificate of Authority (issuance of Inter-Insurance License) service of process may be had upon the Auditor of State in all suits in this state arising out of such policies, which service shall be binding upon all subscribers exchanging at any time Inter-Insurance contracts through such attorney.

There shall at all times be maintained as assets a sum in cash or securities, amounting to 50 per cent of the net annual deposits, collected and credited to the accounts of subscribers, in addition also cash or securities assets sufficient to discharge all liabilities on all outstanding losses arising under policies issued. Net deposits shall be construed to mean the advance payments of the subscribers after deducting the amount agreed upon for expenses. The assets shall not be less than above or $25,000.00.

The attorney shall make a report under oath to the Auditor of State each year giving the financial condition of affairs.

The attorney shall pay annually such taxes, licenses and fees as are required to be paid by a mutual insurance company.

The attorney may insert in any form of policy prescribed by the laws of this State any provisions or conditions required by the plan of reciprocal or Inter-Insurance provided the same shall not be inconsistent with the law of this State.

The theory of the reciprocal or Inter-Insurance is "insurance at the lowest possible rate." Early Automobile Insurance was attempted by the old line companies but automobile insurance with them was experimental and rates excessive. Later automobile insurance companies grew up. They were also expensive. Then the reciprocal law came into existence. It grew up as a result of a demand for cheaper rates. The cheaper rates were accomplished by not having to pay a stock dividend (of all the way from six to ten per cent), by cutting out the commission of a district agent, by doing away with the state agent who received his fee; it did away with the expensive and high salaried offices of president, vice-president, secretary and treasurer. The only expense of a reciprocal organization is that of the attorney.

The attorney is the sole negotiator. He represents both sides. His powers are limited by such articles of agreement as may be adopted by the subscriber.

The theory on which such an association is organized is as follows:

Suppose there are four men in a room (designated A, B, C and D), wanting to indemnify each other against losses as a result of automobile accidents. While the four men are talking, another man (E) comes in and says he would like to get in on it. In order to simplify matters A (attorney) acts as spokesman and asks B, C and D if they are willing to take in E. They all answer "yes" and as a result A negotiates with E. Thus you see that A represents E and also A, B, C and D. As such association grows, it becomes necessary to give A (attorney) certain powers in advance in order to facilitate matters. These powers are enumerated in the articles of agreement. The Attorney-in-fact may be an individual, a partnership or a corporation.

The manner in which such associations are formed is as follows:

A person goes on the street and hunts up 250 friends and asks if they would take out insurance. They accept. The next step is to have $25,000.00 on deposit (by ruling of the Commission of Insurance) in Indianapolis with the Insurance Department. The attorney then makes application for license to issue Inter-Insurance. If such application is granted, he then again sees the 250 men and signs them up for insurance. This person (attorney) acts as your agent in all negotiations. If the 250 want to expand, the attorney solicits subscribers for them.

All premiums are paid to the attorney. Suppose this association styles itself the X Y Z Association. The attorney issues the policy to the new subscriber in behalf of the X Y Z Association. If there is a loss the Attorney signs the check X Y Z Association by "A," Attorney. The X Y Z Association

compendious name for all the subscribers. The attorney makes use of this compendious name in behalf of all the subscribers.

The Attorney is the only expense connected with such insurance (other than losses due to accidents).

Generally the power of Attorney is as follows:

He shall make, issue, change, modify, reinsure or cancel contracts of insurance, containing such terms, clauses, conditions, warranties and agreements as the subscribers shall empower him to. He may demand, collect, receive and receipt for all moneys due the subscriber, or for credit to his account. He may perform or waive all agreements.

He is your agent to accept service and appear for the subscriber in suits, to prosecute, defend, compromise, settle or adjust the same. He executes all documents necessary to comply with the law. In other words, the Attorney is the subscribers' agent and can do just what the articles of agreement permit him to do.

As to Liability: Suppose that the sufficient losses occur so as to necessitate a greater amount of money than is on hand. In such a case just what is the liability of the subscriber? On September 1, 1921, Attorney General of Indiana, Mr. Lesh, said it could be determined by the subscribers. For instance, if there are 250 subscribers, they can agree that no subscriber shall be held for more than 1/250 of the loss. It is a several liability which can be limited as the subscribers see fit.

One of the disadvantages of such insurance lies in the fact that service can be had on any one subscriber and if the Attorney refuses to appear the subscriber has to defend the suit. Of course, the subscriber has recourse against the Attorney. If should be stated, however, that such a disadvantage is only theoretical since the Attorney in your instance (chosen by the subscribing physicians) will undoubtedly appear.

As to Mutuals:

In 1915 the legislature passed an act authorizing the organizing of mutual insurance companies with limited powers. By this act insurance of indemnity is provided for loss in case of auto accidents, theft, etc., other than bodily injury to the person. Twenty or more persons, majority of whom must be bona fide residents of the State of Indiana, may associate themselves together as a corporation under this act. They must make application to the Auditor of State and specify in their application the purpose of the association, and the place of the home office, which must be somewhere in Indiana. Before the Association is permitted to do business, it must have at least 200 risks which must aggregate at least $500,000.00. The Association is limited in the amount of any one risk. No one risk can exceed in amount three times the average risk. The statute also provides that the maximum risk may equal one percent of the aggregate insurance in force. If the aggregate insurance in force is $500,000, a policy of $5,000 may be accepted. If this sum should be larger than three times the average risk, it would be accepted as the maximum. If on the other hand the average risk when multiplied by three should exceed one per cent of the aggregate insurance in force, then that would be accepted as the maximum risk.

The association will be permitted to reinsure, that is, upon taking a risk, the association can, if it so desires, reinsure the risk or a part thereof, in some other company and can, if the associates so desire, accept insurance from other companies. Premiums are required to be paid in cash, and the corporation will be required to keep on hand in cash in an amount not less than twice the maximum of any one single risk and at no time less than $10,000.00 in cash. Also required to have on hand admitted assets at least two times any maximum risk assumed. In case of an organization of the mutual type you will be required to adopt by-laws not inconsistent with this act for your government. The by-laws shall provide for a cash premium. The corporation may limit the contingent liability of its members.

The cash premium above spoken of must be expressed in the policy. The corporation may limit the contingent liability of the policy holder to one premium or to any member above not exceeding ten. This contingent liability must be plainly expressed in the policy. Policy holders shall be members of the Association and may vote in person or by proxy.

We take it from reading the statute that it was intended to cover accidents to autos including theft, fire, property and collision and to afford cheap insurance. The company being mutual, the legislature has thrown certain guards about the plan and put certain limits upon the corporation. These are as to the admittance of the risks; limits the premiums the policy holders will be required to pay, requires certain amount of cash and admitted assets to be on deposit as a protection to the policy holder. All this must be done to the approval of the Auditor of the State. From the reading of the statute it appears that the State Auditor is to keep strict watch over the Association. Should it happen that the Corporation did not have on hands assets at least equal to the unearned premium reserve and other liabilities, the Corporation is required to assess its members liable to assessment in order to provide for such deficiency.

At the first of the opinion concerning Mutuals you recall that loss or damage by reason of bodily injury was excluded. There is a provision in this act under which such insurance may be made (in addition to collision, theft, fire and property discussed above).

To make such insurance, you will note the following:

It differs in that at no time does the statute speak of a $10,000.00 cash deposit. But, it shall hold admitted assets for each kind of insurance (fire, theft, property, collision and liability) equal to at least FIVE times the maximum single risk assumed. The maximum single risk shall not exceed 20 per cent of its admitted assets, or three times the average policy, or one per cent of insurance in force, which ever is the greater, simultaneous reinsurance being deducted in determining the maximum single risk. Otherwise, the provisions are similar.

As to the rights and liabilities of the insured and the insurer in case the insured or policy holder should fail to pay his premium when due, we wish to say that the legislative acts on which we gave our opinion are silent. We, therefore, have to go to the laws governing insurance in general on that proposition. We might say that all policies of insurance provide that in case the policy holder shall fail to pay his premium when due, that his insurance is forfeited and all his rights under the policy are at an end, except the privileges that are given the insured after lapse. The question of payment of the premiums is one of contract and the payment thereof may be made binding upon the insured or policy holder, but as stated above we feel safe in saying that it is the universal rule that where the insured or policy holder permits his premium to lapse, all his rights are forfeited. These provisions are embodied in the policy.

This is true in the case of Inter-Insurance, Mutual Insurance and Stock Insurance. Of course, the delinquent may be reinstated according to the Articles of Agreement or by-laws.

Then, too, in the case of Inter-Insurance in the Articles of Agreement, there is generally found a stipulation to this effect.

"The policy may be revoked or cancelled, by either the Company or the policy holder, by giving to the other ..... days notice in writing. In the event the Company makes the cancellation, it shall return the unearned premium; and in the event the policy holder makes the cancellation, there shall be returned ..... of the unearned premium."

Mutual Insurance is likewise a question of contract, and the by-laws may make a stipulation similar to the one suggested above.

It is to be noted and remembered, however, that the policy holder is liable for all assessments which are the result of any liability or accidents which occur prior to an effective cancellation of said policy.

EMISON & HOOVER.

Of the offers received from reciprocal organizations, that received from the Standard Auto Insurance Association was found to be the lowest and best offer. That offer is herewith submitted in full.

August 15, 1922.

Dr. James McCoy, Chairman,
Committee on Automobile Insurance,
State Medical Association,
Vincennes, Indiana.

Dear Doctor:

With regard to the automobile insurance of members of the Indiana State Medical Association, we hereby authorize you to present to the State Medical Association the following:

The Standard Auto Insurance Association by the Bainum-Phillippe Company, Attorney-in-Fact, agree to

insure the members of the Indiana State Medical Association for the period of one year, the said year to begin at any date fixed by the State Medical Association, on the following rates, to-wit:

INDIANA COUNTRY SCHEDULE

Class	List Price of Pleasure or Commercial Cars	Fire, Lightning and Wind-storm, per $100	Theft, per $100	$25 Deductible Collision	$50 Deductible Collision	$100 Deductible Collision	Full Coverage Collision	Public Liability	Property Damage $1 to $1000

6	3500 to 4999	.60	.40	45.00	32.00	15.00	50.00	12.00	8.00
7	5000 Up	.60	.30	50.00	42.00	20.00	55.00	14.00	9.00

It is understood and mutually agreed that the agents' premium or the membership fee is hereby cancelled on each of the said prospective policies and that the insurance shall be written for each member of the State Medical Association who requires it by means of his application through the Secretary of the County Medical Society in which he resides.

Yours very truly,

THE "STANDARD."
By H. M. ROBBINS.

HMR/AW

The Committee finds that the Standard Auto Insurance Association is a reciprocal concern, organized under the laws of Indiana, with the firm of Bainum-Phillippe Company as Attorney-in-Fact and that the said Bainum-Phillippe Company maintain the central office of this organization at Vincennes, Indiana. Your Committee then proceeded to make a thorough investigation of the financial standing of the Standard Auto Insurance Association. Being cognizant of the fact that the success of a reciprocal association depends largely upon the integrity, business ability and financial stability of the Attorney-in-Fact, a sworn statement was required and obtained from the offices of the Bainum-Phillippe Company, Attorney-in-Fact, setting forth the stockholders in full of the Bainum-Phillippe Company, which is herewith submitted.

August 16, 1922.

Ralph C. Phillippe, being duly sworn, states that the capital stock of the Bainum-Phillippe Company is held by the following persons, to-wit:

Herman Robbins ..... Vincennes, Indiana
Ralph C. Phillippe ..... Vincennes, Indiana
Max S. Kos ..... Vincennes, Indiana
Marion D. Gould ..... Vincennes, Indiana

He further states that the above named constitute the sole stockholders and that the Bainum-Phillippe Company is Attorney-in-Fact for The Standard Auto Insurance Association.

RALPH C. PHILLIPPE.

State of Indiana, County of Knox, ss:

Personally appeared before me, Ralph C. Phillippe and makes oath that the above is a true statement.

WALTER C. McFARLAND, Notary Public.

My commission expires January 16, 1925.

Your Committee then investigated the Bainum-Phillippe Company and find that the stockholders composing it are men of integrity, business ability and financial stability and have a reputation which is perfectly satisfactory wherever they are known.

Your Committee, therefore, recommends that the State Medical Association enter into an agreement with the Standard Auto Insurance Association to the effect that insurance shall be written by the Standard Auto Insurance Association on the automobiles of members of the State Medical Association for the year ending October 30, 1923, at the rates offered by the said Standard Auto Insurance Association. It is further recommended that a Committee be appointed by the State Medical Association for the ensuing year for the purpose of maintaining a connection between the State Medical Association and the Standard Auto Insurance Association and to continue during that year to have the subject of automobile insurance under consideration.

Respectfully submitted,
JAMES N. McCOY, Chairman
ROBLEY D. BLOUNT, Member
CHARLES S. BRYAN, Member

In the discussion which followed Dr. McCoy stated that the taking of this form of insurance (in case the motion carried) would be a purely voluntary act on the part of members of the Association—that there would be no obligation.

In answer to the question how these rates compare with those of the old line companies who issue automobile insurance, Dr. McCoy gave the following figures:

Essex touring car, value $1150.00, old line companies would insure at $950.00; premium $188.00 per year outside Marion County; $255.00 in Marion county. Standard Auto Insurance Company, under the above agreement, would insure at $1,000; premium $56.40 outside Marion county, $76.37 in Marion county.

Hudson car, value $1845.00, old line companies at 1500.00; premium $200.50 country schedule; $275.00 Marion county. Standard Auto Insurance Company, $77.50 and $96.00, respectively.

The full coverage cost of insurance (old line) on a Ford car is $132.20 on $400.00 valuation, outside Marion county; in Marion county, $175.00. Standard Auto Insurance Company, country schedule, $39.00; Marion county, $53.25.

Dr. McCoy's original motion, amended to read that a committee shall be appointed to obtain a liaison with the Standard Auto Insurance Company, was carried.

The president announced that the original committee would be continued.

Moved by Dr. J. N. McCoy that this report be published in full in THE JOURNAL. Motion seconded and carried.

Moved by Dr. George R. Daniels that the report of the Committee on Public Policy and Legislation, as printed in THE JOURNAL, be adopted. Motion seconded and carried.

The president announced that the American Medical Association is asking for the appointment of a committee by this Association to draft resolutions objecting to the training of World War veterans as chiropractors.

It was moved that such a committee be appointed. Motion seconded and carried. The president appointed the following committee, with instructions to report to the House of Delegates Friday morning: F. S. Crockett, Lafayette; P. B. Work, Elkhart; A. M. Mitchell, Terre Haute.

Dr. Edgar F. Kiser, Indianapolis, presented the following memorial to Dr. Albert C. Kimberlin, to Dr. Frank B. Wynn, and Dr. Edwin C. Walker:

RESOLUTION

As the mighty oaks tower above their brothers of the forest, so Albert C. Kimberlin, Frank B. Wynn and Edwin Walker stood preeminent among their fellows. Their lives ran along strikingly parallel lines. Men of humble parentage, their unusual ability and application raised them to the forefront of their profession, not alone within the borders of the State, but throughout the nation.

Modest in demeanor, of untiring zeal, courtly in manner, constantly extending a helping hand to the younger men in medicine, they were beloved of all who knew them. Not alone their confreres, but thousands whom they had befriended, hailed them as benefactors.

The demands upon their time in the practice of their chosen profession did not prevent them giving unusual attention to the pursuit of scientific investigation and research, and medicine has been greatly enriched by their contributions. Nor was medicine their only beneficiary. Our city and state have profited enormously by their activities in civic and communal work.

They were God-fearing men and have left to their families a heritage of which they may well be proud.

The Creator in His wisdom has seen fit to call to their eternal rest these, our esteemed colleagues. We who were proud to be their associates and friends thus give expression to our grief at the loss of these good men and extend to their families our profound and sincere sympathy.

BE IT RESOLVED, that this memorial be made a part of the minutes of the 1922 meeting of the House of Delegates of the Indiana State Medical Association, and that a copy be transmitted to the families.

EDGAR F. KISER,
C. H. McCASKEY,
G. B. JACKSON.

Moved that this memorial be adopted and spread upon the minutes. Motion seconded and carried.

The secretary then read the following communication from the Floyd County Medical Society regarding the Prohibition Law:

Whereas, the Prohibition Law as it at present exists, is unsatisfactory, creates a hardship and is a detriment to the sick and afflicted, and should be so modified and amended as to meet the requirements and conditions of those unfortunates:

Therefore, be it resolved, that the Floyd County, Indiana, Medical Society offer the following resolutions to our Congressmen and Senators.

1. That all Alcohol, Whiskies and Brandies for Scientific and Medical purposes, uses and requirements be put up in sealed containers, of one-half pint, one pint and quart containers for Medical use to the sick.

2. That Alcohol, Whiskies and Brandies be put under the Narcotic Law.

3. That regularly Licensed Druggists and Pharmacists procure it from the Distillers, on permit, in duplicate form Blanks, issued by the Government, the same as for Narcotics.

4. That he can only dispense it on prescriptions of regularly Licensed Physicians duly signed in form, in unbroken seal containers.

5. That only regularly Licensed, on Government permit, Physicians can prescribe alcoholics in unlimited quantity, as may be needed, in the physician's judgment, to meet the requirements and necessities of the patient.

6. That the penalty for the violation of the Alcoholic Act, be the same as for the violation of the Narcotic Act.

Be it further resolved, that a copy of these resolutions be sent to the Secretary of the Indiana State Medical Association, to be presented to the House of Delegates at the next Annual Meeting for consideration and action.

WM. C. WINSTANDLEY,
WM. L. STARR,
P. H. SCHOEN,
Committee.

Moved by Dr. George R. Daniels that this communication be received and placed on file. Motion seconded and carried.

Dr. E. M. Shanklin, chairman of the Medical Defense Committee, offered the following resolution, regarding a change in the By-Laws:

"RESOLVED: That Section 8 of Chapter XI be amended by adding after the word "constitution" in the 17th line, the following: 'nor in case of removal of a member from the State of Indiana'."

This was held over until Friday morning.

Dr. Alfred Henry of Indianapolis offered the following resolution:

"WHEREAS, the Indiana Tuberculosis Association is carrying on a campaign for a more intelligent appreciation of the medical problem, which is evidenced in its program for the prevention and control of tuberculosis, its health activities among children, the organization of county groups stimulating interest among laymen, the progress being made in bringing about the earlier diagnosis of tuberculosis, and increased facilities for the care of tuberculosis; therefore

BE IT RESOLVED, that the Indiana State Medical Association endorse the work of the Indiana Tuberculosis Association and urge the earnest support of the medical profession in furthering its endeavors."

Moved by Dr. George R. Daniels that this resolution be adopted. Motion seconded and carried.

Dr. C. S. Black of Warren, in behalf of the Howard County Medical Society, made the following motion:

"That Howard county be transferred from the Ninth to the Eleventh Councilor District."

Motion seconded and carried.

Dr. A. L. Marshall of Indianapolis, on behalf of the Indianapolis Medical Society, submitted the following resolution:

Whereas, your Committee recognizes the right of the State to supervise Medical education, to conserve the health and well-being of its citizens, and to that end has the privilege and duty of erecting and maintaining institutions for Medical education, for the care and treatment of its indigent population, and has the right and duty of fixing the standard for the proper performance of the Medical Practice Act, and,

Whereas, the State has the right and duty to conduct and maintain adequate State and County Health Boards, and in so far as it fulfills all these above indicated rights and duties, should have and does have the unqualified support of the Medical Profession in the fulfillment of these vested rights, which in no sense conflict with the principles hereinafter set forth, and,

Whereas, certain abuses of the above rights and duties, which abuses, if unchecked, will develop into State Medicine, a term which to most physicians and people, has meant everything and meant nothing, and which may be defined as the sum of a number of growing evil tendencies not commonly interpreted as having any part in Medical Socialism, and,

Whereas, the indicated abuses have been, and are still indulged in, and abetted by the State or its agents, we, therefore, offer the following resolutions as a platform of principles upon which the Indianapolis Medical Society should stand.

RESOLVED—

1. That while the Indianapolis Medical Society heartily supports the proposition that the State should care for its mental and moral defectives, and its indigent sick, it unqualifiedly condemns the tendency of the State to enter into competition with licensed physicians in the practice of Medicine and Surgery, and it condemns the maintenance of pay beds and wards in State Institutions or those partially subsidized by the State.

2. That it condemns the practice of appointing physicians to salaried and advertised positions and at the same time permitting these same salaried officials, free competitive rights against the profession to which

they belong, and declares that no person employed in any of its Medical Institutions, Hospitals, or Colleges, either in whole or in part supported by State funds, who occupies a position of trust or a chair of teaching in any department of Medicine or Surgery and who receives pay or salary for such employment, should be accorded the privilege of private medical or surgical practice, so long as such person is employed by the State and receives pay for services from any State funds of whatsoever character.

3. That it commends the establishment of free clinics for the treatment of tuberculosis, mental hygiene, venereal, and other diseases of the indigent sick, but for no other than the indigent.

4. That it endorses in public health administration, full time salaried officers who shall not, during their service, have the privilege of private practice, nor any right of supervising private practice.

5. That it upholds the standard and purpose of the State Medical Practice Act and insists that all persons engaged professionally, in the treatment of diseases, or the sick, whatsoever, of any description, shall be wholly subject to the same standard of educational qualifications and State examinations.

6. That while, at the present time, it recognizes the necessity of certain societies and industrial development to maintain adequate medical and surgical staffs, it deplores the growing tendency to widen the scope of contract and similar medical and surgical practice wherein the profession is not remunerated according to the usual competitive method and the patient not permitted to use his own selection of physicians.

7. That it condemns legislative enactments relative to all health matters, without the sanction and approval of the licensed and registered Medical Profession.

8. That it opposes lay and political domination of Medical and Surgical practice as opposed to sound public policy and to the scientific progress of medicine.

9. That, while it endorses the efforts of the agents of the Federal and State Governments in their desire to promote the health of the people, it condemns Federal supervision of State medical activities, masquerading under the guise of Federal aid or subsidy.

10. That it condemns the socialistic efforts of State, Federal, County or Municipal agents, to force the expense of private health upon the taxpayers, under the guise of Public Health.

11. That it condemns all "propaganda and elements at work" to create fictitious health problems, as attempts to socialize the Medical Profession, under the plea of "suffering humanity," whereby a great part of an independent people would be segregated into a pauperized class.

12. That it condemns the exploitation of special fields of medicine, surgery and obstetrics, by technicians, who are not qualified, licensed physicians.

Recognizing that the successful treatment of sick people depends upon personal and confidential relations between physician and patient, which relations are impossible under any of the indicated evils: and knowing humanity in its strength and in its weakness, in health and in disease, in wealth and in poverty, we, who dedicate our lives to the scientific investigation, prevention, and treatment of disease, with firm conviction in the ultimate wisdom of our course, offer these resolutions, and pledge our best efforts to uphold all true American ideals and principles.

Be it further resolved, that a true copy of these resolutions be immediately sent to the Secretary of each County Medical Society of the State of Indiana, to the Editor of the Indiana State Medical Journal, and to the Editor of the Journal of the American Medical Association.

Moved by Dr. Albert E. Bulson, Jr., that this resolution be referred to the Council with the request that its action be reported back to the House of Delegates. Motion seconded and carried.

Dr. George F. Keiper of Lafayette offered the following resolution:

"WHEREAS, the Indiana Workmen's Compensation Act provides that companies insuring contractors and concerns against liability for accidents to their employees shall pay for only sixty days of hospital care and professional services rendered the injured coming under the provisions of this Act; and

"WHEREAS, many cases of this nature cannot recover within the sixty-day period; therefore

"BE IT RESOLVED by the House of Delegates of the Indiana State Medical Association that an amendment to this Act to cover all treatment and care necessary in these cases be procured from the next session of the General Assembly, and that this task be committed to the Committee on Public Policy and Legislation."

Dr. Keiper moved the adoption of this resolution. Motion seconded and carried, and the resolution referred to the Committee on Public Policy and Legislation.

There being no further business to come before the House of Delegates, adjournment was taken to meet at eight o'clock Friday morning in the High Street Methodist Church.

SECOND MEETING

Pursuant to adjournment the House of Delegates convened at eight-ten, September 29th, in the High Street Methodist Church, the president, Dr. W. R. Davidson, presiding.

Roll-call of delegates.

The first order of business was election of officers, which resulted as follows: President, Charles H. Good, Huntington; first vice-president, Wilson T. Lawson, Danville; second vice-president, John H. Reed, Logansport; third vice-president, Charles S. Bryan, Vincennes; secretary-treasurer, Charles N. Combs, Terre Haute. Delegates to American Medical Association—J. R. Eastman, Indianapolis; alternate, M. R. Combs, Terre Haute. Committee on Administration and Medical Defense—David Ross, Indianapolis (to fill unexpired term of Dr. Frank B. Wynn); George R. Daniels, Marion (re-elected for ensuing three years). Committee on Hospital Standardization—E. J. Lent, South Bend (re-elected for ensuing five years).

Dr. F. S. Crockett, for his committee, made the following report:

"WHEREAS, it appears that a number of ex-service men from all parts of the country are being enrolled in schools for the training in Chiropractic with the sanction and approval of the United States Government as a proper vocational training for disabled ex-service men; therefore

"BE IT RESOLVED, that the House of Delegates of the Indiana State Medical Association, in annual session assembled, representing the legally qualified physicians of Indiana, of whom there are over 6,500, approves the sentiments expressed in the resolution adopted by the American Medical Association at its annual meeting at St. Louis in June, 1922, condemning this action by the Federal Government, and hereby directs that the proper officials of this Association memorialize and petition the Federal Government, and particularly the Director of the Veterans' Bureau and the Assistant Director in charge of the Rehabilitation Division of that Bureau, and each Senator and Representative from this State, and to take such other action in the interest of the welfare of all the people, and also for the protection of those who honestly desire to administer to the sick, to the end that the ex-soldiers seeking vocational training which will fit them for ministering to the sick and aiding in the recognition, control and prevention of disease, shall be sent to schools equipped to give adequate training and which at least meet the requirements of the American Medical Association for Class "A" Medical schools.

F. S. CROCKETT, Chairman."

Moved that this resolution be adopted. Motion seconded and carried.

The president announced the following ruling—that in the case of the death of a Councilor during the year, the president of the District Society shall have power to appoint a successor for the unexpired term. (Taken by consent.)

Dr. Frank W. Black of Ligonier brought up the matter of medical inspection in schools, and in connection therewith read the state law (which follows), the last clause of which should be amended:

"Sec. 5, page 340, Acts 1921: The school superintendent of any attendance district may make or have made an examination of any or all children between the ages of seven and sixteen years and may exclude or excuse from school any child found mentally or physically unfit for school attendance, provided such exclusion or excuse is approved and certified to by a physician in good standing, and providing further that such exclusion or excuse shall be valid for not longer than the school year during which it is issued.

PROVIDED that no pupil or minor shall be compelled to submit to medical examination or treatment under authority of this section whose parent or

guardian objects to the same. Such objection shall be made by written and signed statement delivered to the pupil's teacher or to any person who might conduct such examination or treatment in the absence of such objection."

Moved that this matter be referred to the Committee on Public Policy and Legislation. Motion seconded and carried.

Dr. Albert E. Bulson, Jr., read the following report of the Council, regarding the resolution of Dr. Marshall:

"House of Delegates,
Indiana State Medical Association.
Gentlemen:

Your Council desires to make the following report concerning the resolution referred by you for consideration:

With the exception of the first two paragraphs, the Council approves and heartily endorses the resolution.

Concerning the first two paragraphs, which concern the management and policies of hospitals, medical schools and other institutions under State control, your Council believes that the subject deserves further study and investigation before this Association passes judgment upon the matters considered.

Realizing the fact that the medical department of the Indiana State University, and the hospitals and other institutions directly or indirectly connected therewith, should have the cordial support of this Association and each and every individual member thereof, and realizing that the rank and file of the membership of this Association may not be acquainted with the policies of such institutions and therefore are not giving such enterprises the endorsement and support that they desire, the Council begs leave to recommend that the President of this Association appoint a committee of three and not more than five members of the Association, to meet the Trustees of Indiana University and officers of the medical department of the University and hospitals connected therewith, for the purpose of obtaining full and detailed information concerning the management and policies of such enterprises, such information to be embodied in a report to be printed at once in the JOURNAL of this Association, to the end that the representative medical men of the State forming this Association may have a more accurate idea of the functions and policies of those institutions and the manner of their management.

Your Council makes this recommendation solely with the view of bringing about a better understanding between the medical profession of the State and the medical department of Indiana University, and with the hope that the conference suggested will result in mutual advantage and the encouragement of co-operation and harmony in promoting the interests of both.

Your Council further recommends that the actual expenses of such a committee as recommended shall be borne by this Association.

Furthermore, pending the report of the committee, your Council recommends that the resolutions sent for consideration be laid upon the table for further action.

Respectfully submitted,
ALBERT E. BULSON, JR.,
J. H. WEINSTEIN,
S. E. EARP,
Committee of the Council."

Moved by Dr. A. M. Hayden that this report be adopted. Motion seconded and carried.

The president announced that this committee would be appointed within a day or two.

Dr. A. H. Rhodes presented the following suggested amendment to Paragraph 8423, Burns' Revised Statutes of 1914:

"In addition to the penalties herein provided, the judges of the various Circuit Courts in this State shall have the power, and it is made their duty, to grant restraining orders and injunctions against any person practicing medicine, as herein defined, until such time as such person shall have obtained the license so to practice in the manner and in the form as herein provided; and such judges shall have all powers in such connection as they may have in issuing other injunctions."

This was referred to the Committee on Public Policy and Legislation with the recommendation that it be presented to the next session of the Legislature.

Dr. W. R. Davidson, president, took the floor to speak on the idea of engaging a field secretary who would give his entire time to speaking before lay audiences throughout the state.

Dr. J. A. MacDonald moved that the Chair appoint a committee of three to arrange for the selection of an Educational Secretary, whose duties and salary would be defined by the Council.

Motion seconded by Dr. Alfred Henry and carried.

Dr. F. W. Cregor was allowed the privilege of the floor in order to speak in favor of the appointment of Dr. J. N. Hurty of Indianapolis, retiring State Health Commissioner, to the position of Educational Secretary.

The House of Delegates, having thus created the Committee on Public Education, the president announced the personnel of that committee as follows: W. N. Wishard, Indianapolis; David Ross, Indianapolis; F. W. Cregor, Indianapolis.

Dr. J. A. Craig of Greenwood moved the appointment of a committee of from three to five, to which shall be referred the matter of investigating the feasibility of reorganizing the Indiana State Medical Association so as to increase the size of the constituent units, said committee to report to the next annual session. Motion seconded by Dr. George D. Miller of Logansport, and carried.

Dr. George T. McCoy of Columbus, speaking on the subject of the difficulty of maintaining societies in the smaller counties, cited the example of his own county in obviating the existing difficulties. He said that Bartholomew county had an unwritten agreement with the counties of Jackson and Jennings whereby joint meetings of the three societies were held, first in one of the counties and then another. This arrangement increased the interest as well as the attendance at the meetings and yet enabled the physicians in each county to meet once a month.

Following this a discussion ensued, led by Drs. Harry Knott of Plymouth, O. T. Brazelton of Princeton, and J. N. McCoy of Vincennes, concerning the chiropractic question.

No further business presenting, the meeting adjourned. CHARLES N. COMBS, *Secretary*.

GENERAL MEETINGS

FIRST MEETING

The first General Meeting was held in the High School Auditorium, Muncie, Indiana, September 28, 1922, being called to order at nine-fifteen a. m. by the president, Dr. William R. Davidson, Evansville, Indiana. The president announced that the address of welcome by the mayor of Muncie had been printed in the Muncie *Dynamo*, in order that it might have a wider circulation.

The president read his address, entitled "The Status of the Profession in Indiana".

On motion, duly seconded, Dr. J. E. Rush, of New York City, was permitted to speak for ten minutes on behalf of the American Society for the Control of Cancer.

Dr. George W. McCaskey, Fort Wayne, Indiana, read a paper entitled "The Medical Phase of Endocrinology".

Dr. C. C. Bitler, Newcastle, read a paper entitled "The Neurological Phase of Endocrinology".

Dr. W. D. Gatch, Indianapolis, read a paper entitled "The Surgical Phase of Endocrinology".

The above symposium was discussed by Drs. Edgar F. Kiser, Indianapolis; Albert E. Sterne, Indianapolis; Charles P. Emerson, Indianapolis; Tom Jones, Anderson; C. H. Good, Huntington; George W. Spohn, Elkhart; C. S. Bond, Richmond; George F. Keiper, Lafayette; Charles Stoltz, South Bend; J. R. Eastman, Indianapolis; Charles A. Sellers, Hartford City; Grace L. Homan, Laporte; and the discussion closed by Drs. George W. McCaskey, C. C. Bitler and W. D. Gatch.

Adjourned.

SECOND MEETING

The last General Meeting convened at two o'clock p. m. September 29th. the newly-elected president, Dr. C. H. Good, of Huntington, presiding.

Dr. Charles F. Neu. Indianapolis, read a paper entitled "Meningitis: Differential Diagnosis".

Dr. Miles F. Porter, Jr., Fort Wayne, read a paper entitled "Meningitis: Treatment".

Dr. Harry Boyd-Snee, South Bend, read a paper entitled "Otitic Meningitis".

The above symposium was discussed by Drs. Robert M. Moore, Indianapolis; D. O. Kearby, Indianapolis; C. Norman Howard, Warsaw; C. H. McCaskey, Indianapolis; Charles G. Beall, Fort Wayne; Charles A. Sellers, Hartford City; and the discussion closed by Drs. Charles F. Neu, Miles F. Porter, Jr., and Harry Boyd-Snee.

The president, Dr. C. H. Good, expressed to the physicians of Muncie the appreciation of the State Medical Association for the very satisfactory way in which they had taken care of the meeting, both from a social and scientific standpoint.

The meeting adjourned *sine die*.

SECTION ON SURGERY

FIRST MEETING

The Section on Surgery met in the High School Auditorium, the first meeting called to order at two p. m. September 28th, by the chairman, Dr. A. S. Jaeger, of Indianapolis.

Dr. Charles H. Frazier, Philadelphia, delivered the address in surgery, entitled "The Trend of Neurological Surgery".

A rising vote of thanks was tendered Dr. Frazier for his splendid address.

Dr. J. Rilus Eastman, Indianapolis, read a paper entitled "A Safe Method for Drainage of Intra-Abdominal Abscesses". This paper was discussed by Drs. Miles F. Porter, Sr., Fort Wayne; Harry G. Gradle, Kokomo; Walter U. Kennedy, Newcastle, and the discussion closed by Dr. J. Rilus Eastman.

Dr. A. C. Roope, Columbus, read a paper entitled "Thyroid Disease". This paper was discussed by Drs. F. H. Jett, Terre Haute; W. E. Klingler, Garrett, and the discussion closed by Dr. A. C. Roope.

Dr. Frank W. Foxworthy, Indianapolis, read a paper entitled "Diagnosis of Duodenal Ulcer". This paper was discussed by Drs. W. H. Foreman, Indianapolis; Miles F. Porter, Sr., Fort Wayne; H. O. Pantzer, Indianapolis; A. M. Hayden, Evansville; A. B. Graham. Indianapolis; H. H. Wheeler, Indianapolis; Albert M. Cole, Indianapolis; Thomas B. Noble, Indianapolis; C. F. Voyles, Indianapolis, and the discussion closed by Dr. Frank W. Foxworthy.

Dr. F. C. Walker, Indianapolis, read a paper entitled "Reconstruction of Perineal Genito-Urinary Childbirth Injuries". This paper was discussed by Drs. A. A. Rang, Washington; J. H. Weinstein, Terre Haute; G. D. Marshall, Kokomo; Charles J. Rothschild, Fort Wayne; G. B. Jackson, Indianapolis; Walter U. Kennedy. Newcastle; and the discussion closed by Dr. F. C. Walker.

Dr. E. E. Padgett, Indianapolis, read a paper entitled "Tuberculosis of the Female Generative Organs". This paper was discussed by Drs. Carl Habich, Indianapolis; G. B. Jackson, Indianapolis; James S. Shaffer, Terre Haute; P. C. McCown, Indianapolis; Karl R. Ruddell, Indianapolis; and the discussion closed by Dr. E. E. Padgett.

Adjourned.

SECOND MEETING

Pursuant to adjournment the Section on Surgery reconvened at nine-fifteen a. m. September 29th, with the vice-chairman, Dr. T. C. Kennedy of Indianapolis, presiding.

The first order was election of officers, which resulted as follows: Chairman, A. P. Roope, Columbus; vice-chairman, G. B. Jackson, Indianapolis; secretary, Merrill S. Davis, Marion.

Dr. A. M. Mendenhall, Indianapolis, read a paper entitled "Occiput Posterior Positions: Early Diagnosis and Various Methods of Treatment". This paper was discussed by Drs. Clay Ball, Muncie; G. B. Jackson, Indianapolis; Homer Wollery, Bloomington; Charles J. Rothschild, Fort Wayne; Herbert D. Fair, Muncie; and the discussion closed by Dr. A. M. Mendenhall.

Dr. H. A. Duemling, Fort Wayne, read a paper entitled "Technique of Cholestectomy". There was no discussion of this paper.

Dr. Simon J. Young, Gary, read a paper entitled "Some Observations on Gall Bladder Surgery". This paper was discussed by Drs. E. S. Jones. Hammond; G. G. Eckhart, Marion; John H. Eberwein, Indianapolis; W. E. Klingler, Garrett; H. A. Duemling, Fort Wayne; Walter H. Williams, Lebanon; M. A. Austin, Anderson; and the discussion closed by Dr. Simon J. Young.

Dr. M. A. Austin, Anderson, read a paper entitled "Repair of Three Uncommon Fracture Cases, with the Use of an Original Crucifixion Splint in Fracture of the Surgical Neck of the Humerus". This paper was discussed by Drs. E. H. Clauser, Muncie; H. R. Allen, Indianapolis; G. D. Marshall, Kokomo; C. C. Cotton, Elwood; and the discussion closed by Dr. M. A. Austin.

Dr. G. D. Marshall, Kokomo, read a paper entitled "Diseases and Injury to the Hip Joint". This paper was discussed by Drs. C. C. Terry, South Bend; H. R. Allen, Indianapolis, and the discussion closed by Dr. G. D. Marshall.

Dr. H. R. Allen, Indianapolis, read a paper entitled "The Surgical Engineer". This paper was discussed by Drs. Louis D. Belden, Indianapolis; Walter H. Williams, Lebanon; William S. Ehrich, Evansville; M. A. Austin, Anderson; G. D. Marshall, Kokomo; and the discussion closed by Dr. H. R. Allen.

Adjourned.

SECTION ON MEDICINE

FIRST MEETING

The first meeting of the Section on Medicine of the Indiana State Medical Association was called to order in the Hotel Roberts, Muncie, at 2:30 p. m. Thursday, September 28, 1922, by the chairman, Dr. George C. Richardson, Van Buren.

Dr. T. F. Bowles moved that a committee of three be appointed to draft resolutions on the death of Dr. Kimberlin, Dr. Wynn and Dr. Walker. Motion seconded and carried.

The chairman appointed a committee for this purpose consisting of Drs. Charles Good, Huntington; W. A. Fankboner, Marion, and Dr. Frank.

Dr. E. F. Kiser stated that he was heartily in favor of the motion but that a similar motion had been passed by the House of Delegates, and on motion duly seconded and carried Dr. Kiser read the resolutions that had been drafted by that committee.

Dr. Chas. P. Emerson moved that the committee from the Section on Medicine recognize these resolutions. Seconded and carried.

Dr. John H. Warvel, Indianapolis, presented a paper on "Some Observations on Cases Showing a Disturbance of Carbohydrate Metabolism".

This paper was discussed by Drs. B. M. Edlavitch, Fort Wayne; C. R. Strickland, Indianapolis; T. F. Bowles, Muncie; Allen Hamilton, Fort Wayne; C. A. Sellers, Hartford City; J. A. MacDonald, Indianapolis; C. F. Voyles, Indianapolis; and the discussion closed by Dr. Warvel.

Dr. O. G. Pfaff, Indianapolis, read a paper on "Congenital Pyloric Stenosis".

This paper was discussed by Drs. James C. Carter,

Indianapolis; W. D. Gatch, Indianapolis; Louis H. Segar, Indianapolis; and the discussion closed by Dr. Pfaff.

Dr. Charles Good reported that the committee to consider resolutions on the death of Drs. Kimberlin, Wynn and Walker had accepted the resolutions passed by the House of Delegates, but would like to send a copy to the families of the deceased suitably inscribed and placed in a dark green cover, green being symbolic of memory.

Dr. Alfred Henry moved that the report of the committee be accepted. Seconded and carried.

Dr. Alfred Henry presented a paper on "The Treatment of Pulmonary Tuberculosis".

This paper was discussed by Drs. G. C. Johnson, Evansville; Charles R. Bird, Greensburg; W. A. Evans, Chicago; John N. Hurty, Indianapolis; T. F. Bowles, Muncie; Chas. P. Emerson, Indianapolis; Geo. F. Beasley, Lafayette; Chas. S. Bond, Richmond; and the discussion closed by Dr. Henry.

Owing to the lateness of the hour it was moved and seconded that the paper of Dr. J. E. Luzadder be postponed until the morning session.

Adjournment at 5:45 p. m. to reconvene at 8:30 a. m. Friday, September 29.

SECOND MEETING

The second meeting of the Section on Medicine was called to order at 9:00 a. m. Friday, September 29, 1922, by the chairman, Dr. George C. Richardson, Van Buren.

Dr. J. E. Luzadder, Bloomington, read a paper on "The Therapy of Syphilis".

This paper was discussed by Drs. Chas. P. Emerson, Indianapolis, and Wm. S. Ehrich, Evansville.

At this point the vice-chairman, Dr. R. H. Beeson, Muncie, took the chair.

Dr. James Wynn, Indianapolis, presented a paper entitled "Sensitivity to Epidermal and Pollen Proteins; Diagnosis and Treatment".

This paper was discussed by Drs. C. G. Beall, Fort Wayne; Charles S. Bosenbury, South Bend; Oscar T. Scamahorn, Pittsboro; B. M. Edlavitch, Fort Wayne; David L. Kahn, Indianapolis; and the discussion was closed by Dr. Wynn.

Dr. Charles Louis Mix, Chicago, delivered the address in medicine entitled "Biliary Tract Infection and Its Differentiation from Ulcer". (No discussion.)

Dr. S. C. Waters, Middletown, presented a paper on "Epidemic Jaundice".

This contribution was discussed by Drs. W. M. Stout, Newcastle; Will P. Shimer, Indianapolis; W. A. Fankboner, Marion; W. W. Wadsworth, Muncie; C. A. Sellers, Hartford City; and the discussion was closed by Dr. Waters.

The chairman now resumed the chair.

Dr. W. A. Fankboner asked the consent of the Section and his discussants to have his paper read by title only and published in THE JOURNAL. On motion duly seconded and carried this consent was granted.

At the suggestion of the chairman a vote of thanks was tendered by the Section to the Muncie Academy of Medicine, the local profession and the management of the Hotel Roberts for their hospitality and efforts for the success of the meetings.

The following gentlemen were elected as Section officers for the ensuing year: Chairman, Dr. B. R. Kirklin, Muncie; vice-chairman, Dr. W. A. Fankboner, Marion; secretary, Dr. C. G. Beall, Fort Wayne.

Dr. Richardson introduced the newly elected chairman to the Section and announced that this was thought to be the largest meeting ever held by the Indiana State Medical Association, as there were approximately six hundred physicians in attendance. He also announced that Terre Haute had been selected as the meeting place for 1923.

The chairman then introduced the newly elected President of the Association, Dr. Charles Good, to the Section and Dr. Good responded with a few remarks.

As this completed the program, on motion duly seconded and carried, the Section on Medicine adjourned at 12:40 *sine die*.

SECTION ON OPHTHALMOLOGY AND OTOLARYNGOLOGY

FIRST MEETING

The Section met in the Grill Room of the Roberts Hotel Thursday afternoon, September 28th, and was called to order at 2 p. m. by the chairman, Dr. C. H. McCaskey, who delivered an address. He selected for his subject "A Brief Review of Otology to the Beginning of the Nineteenth Century".

Dr. William B. Chamberlain, Cleveland, Ohio, read a paper (by invitation) entitled "Endonasal Operations on the Lachrymal Sac", which was discussed by Drs. G. W. Spohn, Elkhart; C. H. McCaskey, Indianapolis; Harry Boyd-Snee, South Bend; C. Norman Howard, Warsaw; Albert E. Bulson, Jr., Fort Wayne; C. J. Adams, Kokomo, after which the discussion was closed by the essayist.

Dr. Albert E. Bulson, Jr., Fort Wayne, read a paper entitled "Cycloplegics in Refraction Work".

This paper was discussed by Drs. A. L. Marshall, Indianapolis; R. W. Cochran, Madison; George F. Keiper, Lafayette; W. A. Hollis, Hartford City; O. G. Brubaker, North Manchester; Don L. Miller, Indianapolis, and in closing by the essayist.

Dr. F. S. Cuthbert, Kokomo, read a paper entitled "System and Thoroughness in Eye Examinations and Treatment", which was discussed by Drs. W. A. Hollis, Hartford City; G. W. Spohn, Elkhart; George F. Keiper, Lafayette, and Albert E. Bulson, Jr., Fort Wayne, after which the discussion was closed by the author of the paper.

On motion, the Section adjourned until 9 a. m. Friday, September 29.

SECOND MEETING

The Section met at 9 a. m. Friday, September 29, and was called to order by the chairman.

The following officers were nominated and elected: Chairman, Dr. C. J. Adams, Kokomo; vice-chairman, Dr. Harry Boyd-Snee, South Bend; secretary, Dr. E. M. Shanklin, Hammond, re-elected.

Dr. W. F. Hughes, Indianapolis, read a paper entitled "Cataract Extraction and Its Complications".

This paper was discussed by Drs. Frank A. Morrison, Indianapolis; G. W. Spohn, Elkhart; W. A. Hollis, Hartford City; B. W. Egan, Logansport; C. J. Adams, Kokomo; O. G. Brubaker, North Manchester, and in closing by the essayist.

Dr. W. S. Tomlin and Dr. D. S. Adams, Indianapolis, contributed a joint paper entitled "Phases of Chronic Laryngeal Infection", which was discussed by Drs. K. T. Brown, Muncie; G. W. Spohn, Elkhart; D. O. Kearby, Indianapolis; C. Norman Howard, Warsaw; Harry A. Van Osdol, Indianapolis; W. A. Hollis, Hartford City; Carl H. McCaskey, Indianapolis, after which the discussion was closed by Dr. Tomlin.

Dr. G. W. Spohn, Elkhart, read a paper on "Eye Drainage".

This paper was discussed by Drs. C. Norman Howard, Warsaw; D. O. Kearby, Indianapolis; W. F. Hughes, Indianapolis; Albert E. Bulson, Jr., Fort Wayne; Harry Boyd-Snee, South Bend, and in closing by the essayist.

As there was no further business, scientific or otherwise, to come before the Section, the meeting adjourned *sine die*.

THIRTEENTH DISTRICT MEDICAL SOCIETY

The 34th meeting of the Thirteenth District Medical Society was called to order by President B. F. Overmyer, at 1:30 p. m. September 1, in the pavilion of the Lakeview Hotel, Lake Manitou, Rochester, Indiana.

The minutes of the preceding meeting were read and approved. The treasurer's report was read and referred to the auditing committee, Drs. Charles Stoltz, Harry Knott and C. S. Campbell, who later reported it correct and on their recommendation it was accepted by vote of the society.

The nominating committee, Drs. C. E. Reed, E. O. Kreuger and G. W. Thompson, submitted the following ticket: For president, H. O. Shafer, Rochester; vice-president, J. N. Kelly, Westville; secretary-treasurer, James A. Work, Jr., Elkhart; councilor, C. Norman Howard, Warsaw. These candidates were elected by unanimous vote of the society.

The resolutions committee, Drs. J. B. Berteling, C. C. Terry and F. P. Eastman, presented the following resolutions on the death of Dr. Enos Musser Hoover:

WHEREAS, It has pleased Almighty God in His infinite wisdom and justice to call to his eternal home His servant, Dr. Enos M. Hoover,

THEREFORE, BE IT RESOLVED, That the untimely death of Dr. Hoover has been a loss to the medical profession because of his high medical standard, to his fellow citizens because of his sterling integrity, to his community at large because of his many philanthropic services, especially as member of the Anti-Tuberculosis Society and as president of the Child's Welfare League.

BE IT FURTHER RESOLVED, That the 13th District Medical Society extend to the family of the deceased and to his fellow citizens its profound sympathy and condolences.

BE IT FURTHER RESOLVED, That a copy of these resolutions be sent to the family of the deceased, to the press of Elkhart and Goshen and that the same be spread on the records of this, the 13th District Medical Society of the State of Indiana.

C. C. TERRY,
F. M. EASTMAN,
J. B. BERTELING,
Committee.

Rochester, Indiana, September 1, 1922.

The resolutions were accepted by vote of the society. The secretary sent copies to Mrs. Hoover and to press as instructed.

The invitation of the Marshall County Medical Society to hold the next annual meeting in Plymouth, made through Dr. Harry Knott, was accepted by unanimous vote of the society.

The report of the Committee on Constitution and By-Laws by Dr. C. N. Howard, chairman, was to the effect that the committee considered that no revision was necessary. Accepted by consent.

All committees were duly appointed by the president.

The following program was given: (1) "The Surgical Measures Employed for the Relief of Gastric and Duodenal Ulcers" (illustrated by lantern slides and operations on the dog)—E. A. Printy, Chicago. (2) "When Are Gastric and Duodenal Ulcer Cases Medical and When Surgical?"—B. F. Kuhn, Elkhart. Discussion: C. C. Terry, South Bend; Charles Stoltz, South Bend, and B. F. Kuhn, closing. (3) "Prenatal Care of the Mother"—C. L. Slonaker, Culver. Discussion: J. N. Kelly, Westville; E. O. Kreuger, Michigan City; C. G. Mackey, Culver; Charles Stoltz, South Bend; F. R. Clapp, South Bend, and C. L. Slonaker, closing. (4) "Obscure Headaches of Nasal Origin"—R. A. Barlow, South Bend. Discussion: J. B. Porter, Elkhart; C. N. Howard, Warsaw, and R. A. Barlow, closing. (5) In the absence of Dr. C. C. Dubois, Warsaw, who was ill, Dr. Wm. Kelsey, Monterey, presented a few remarks on the treatment of diphtheria. Dr. Kelsey, aged 87, who has been practicing medicine 67 years, is the senior member of the society.

After an enjoyable hour spent in bathing in Lake Manitou and in visiting, the members banqueted at 6:30 at the Country Club. The after-dinner address was given by Dr. Vernon C. David, Chicago, on the subject, "Consideration of the Pathology and Therapy of a Few Rectal Lesions." Dr. David's paper was illustrated by lantern slides.

During the forenoon the golf-playing portion of the membership indulged in a variety of brands of that famous game commensurate with the number playing. So far as the secretary was able to determine the honors were impartially divided.

This meeting was the largest in the history of the society, having been attended by 86 members and visitors.

Adjournment.

JAMES A. WORK, JR.,
Secretary.

CORRESPONDENCE

Muncie, Ind., September 5, 1922.

EDITOR THE JOURNAL:

Several of my medical friends throughout the state have copies of my *Medical History* which were left with them for sale. Please say to these parties that I would be glad to have them return to me at my expense to Muncie, Indiana, any unsold copies.

Respectfully,
G. W. H. KEMPER.

TRUTH ABOUT MEDICINES

PROPAGANDA FOR REFORM

ETO-SO-ERC:—A circular letter, signed T. M. Berry, M.D., New Orleans, recommends the intravenous use of "Eto-So-Erc" ("Creosote" spelled backward) in the treatment of pulmonary tuberculosis, influenza, pneumonia, bronchitis and pulmonary gangrene. Eto-So-Erc is stated to be a "highly purified form of Beechwood Creosote, especially prepared for intravenous administration". It is asserted that "it comes in direct contact and becomes fixed to the pathologic tissue and bacteria". Creosote is credited with being of some value in tuberculous infections when taken orally. It is most probable that any benefits derived from the administration of creosote are due to the local effect on the alimentary canal, on the bronchitis and to the antipyretic action; hence, the benefits would not be obtained from its intravenous injection. The argument is advanced for Eto-So-Erc that, in respiratory infections, tubercle bacilli are destroyed by blood containing small amounts of creosote. This assertion is misleading because the tubercle bacilli in the lungs are embedded in the tissues and, therefore, are inaccessible to the creosote said to be contained in Eto-So-Erc. To give creosote, a readily absorbed drug, intravenously is irrational and unscientific.—(*Jour. A. M. A.*, Aug. 5, 1922, p. 492).

ZINC STEARATE DUSTING POWDERS.—Untoward effects from the accidental aspiration of zinc stearate dusting powder by infants are reported. In some cases, bronchopneumonia, of a more or less fulminating type, has ensued. In other infants, an acute toxemia was the most conspicuous symptom. The zinc stearate container, with its large perforations, as now prepared for the nursery, appears to be a distinct menace to the health of infants.—(*Jour. A. M. A.*, Aug. 19, 1922, p. 663).

THE "NATURAL HEALTH SCHOOL" seems to be the latest creation of Milo Erskine Yergin and Mr. [illegible]

In 1920, Yergin was president of the "Co-operative Food Company". This concern advertised "Dr. Yergin's Pus and Pain Chart". The chart sold for $10 and was advertised with the claim that it would enable one, "with the simple foods of nature", to control and obliterate completely, in from fifteen minutes to fifteen hours, any kind of pain and all pus conditions. The use of the chart required "Sea Food Baths", "Earth Food Table Salt". "Food Iodine", "Cinnamon Food Oil", "Myrrh Compound", and "Cold Food". All were for sale by the Co-operative Food Company at prices ranging from 25 cents to $3 a package. The Natural Health School seems to combine a strong mixture of religious fanaticism with the practice of the healing art.

Yergin put forward a "True Musical Therapy" whereby, with the aid of a piano "thoroughly in tune and having high quality strings", it is possible to produce vibration rates corresponding to chemical elements! It is asserted that if the keys corresponding to mercury and chlorine are struck, a sensitive person will respond with a flow of saliva in the mouth. If the keys are kept sounding for a few moments, a bowel action will be started. The possibilities in treating stomachache, soft corns, psoriasis or smallpox by playing the piano seem unlimited. The preposterous nonsense promulgated by Yergin is, apparently, accepted at its face value by many laymen and not a few so-called "drugless practitioners". The harm that men of this type can do is realized when one reads of persons who are "treating" sufferers from tuberculosis, cancer and equally serious conditions by the fantastic principles laid down by Yergin, and by the nostrums sold by him.—(*Jour. A. M. A.*, Aug. 26, 1922, p. 757).

HELIOTHERAPY.—The action of far ultraviolet light on normal tissue and the action of near ultraviolet light under certain pathologic conditions have been investigated enough to show that there are well defined effects due to light, closely related to the physiologic results of exposure to radium and the roentgen rays. Recently, Kramer, Casparis and Howland have again demonstrated the healing of the rachitic process in the bones of rachitic children through systematic exposure to the rays from the mercury vapor quartz lamp. The healing of the bones occurred at about the same time that it does after the administration of cod liver oil. The work of Finsen in the treatment of *lupus vulgaris* emphasizes the importance of considering a diversity of forms of radiant energy in skin affections. In tuberculosis, especially surgical tuberculosis, heliotherapy has long had advocates. Light of short wave length, which is known to have marked bactericidal effects, may not be without salutary influence in the treatment of wounds. Artificial lights, if glass covered, are therefore harmless and therapeutically weak. Sunlight rarely contains enough far ultraviolet rays to produce injury. Consequently, heliotherapy that demands highly potent effects must look to artificial sources of radiation. The quartz mercury arc and bare metallic arcs are known to belong in the potent class, and, it is to be remembered, may be extremely injurious, so that the eyes should be protected from them.—(*Jour. A. M. A.*, Sept. 2, 1922, p. 827.)

INTRAVENOUS MEDICATION.—There are serious limitations to intravenous medication which are likely to be forgotten or overlooked in the enthusiasm for a promising procedure. They involve both disappointments and dangers. These were reviewed by Carl Voegtlin before the Section on Pharmacology and Therapeutics at the St. Louis session of the American Medical Association. Not the least in importance are the difficulties of technic which form a stumbling block for all too many physicians. Voegtlin pointed out that the chemical composition of the blood and its physicochemical properties, such as osmotic pressure, hydrogen-ion concentration and colloidal state, are maintained with remarkable constancy and appear to be essential to physiologic well-being. A sudden change in reaction, the production of precipitates and subsequent thrombosis in vital organs, the overwhelming of sensitive tissues, such as the cardiac and nervous structures, with high concentration of potent drugs, are a few illustrations of the untoward possibilities in a procedure that often means "more haste and less speed".—(*Jour. A. M. A.*, Sept. 2, 1922, p. 828.)

LEACH CANCER CURE.—The Indianapolis Cancer Hospital is conducted by C. C. Root and C. A. McNeill. This was formerly called the "Parkview Sanatorium" and later the "Leach Sanatorium". This business was started by Leon T. Leach, mainly as a mail-order "cure" for cancer. When Leach's business was declared a fraud and debarred from the mails, the name was changed to "Leach Sanatorium". Later the name was changed to its present style and McNeill became president and Charles C. Root treasurer. As the list of those claimed to have been successfully treated by Root and McNeill appeared in Leach's old testimonials, one is justified in assuming that Root and McNeill use the Leach Method. At the time the federal authorities interfered with Leach's business, an analysis was made by the government chemists of the "cure". In effect, the report was:

"'CANCEROL BLOOD RENOVATOR'.—This preparation was labeled in part: 'A compound of Essential Oils for the treatment of Malignant Diseases. Predigested Oils for internal administration.' The federal chemists reported that the stuff contained 10 percent of alcohol, a little more than 16 percent of total solids, almost wholly sugars, no alkaloids and no oils. It had an odor resembling sarsaparilla and senega. It was not a 'compound of essential oils', neither were there any 'predigested oils' present.

"'Cancerol'.—This was nothing but cottonseed oil.

"'Special Germ Killer and Disinfectant'.—This was a disinfectant of the creosol type and was to be used by diluting one teaspoonful in three pints of hot water. Bacteriologic tests showed that the solution, when diluted as prescribed, has little if any germicidal value.

"Pills.—These were colored red and sugar-coated; they were found to consist essentially of baking soda, iron (ferrous) sulphate, a small amount of red pepper and glucose.

"The above comprised the 'treatment' for 'internal' cancer; for 'external' cancer the victims received the Cancerol Blood Renovator and the Pills as described above and, in addition:

"'Night Oil'.—This, like 'Cancerol', was found to be a small bottle of cottonseed oil.

"'Day Oil'.—This was a half-ounce bottle of ichthyol.

"'Prescription 16'.—Found to be an alcoholic preparation containing opium.

"'Healing Salve'.—This, according to the federal chemists, was vaseline in which were incorporated boracic acid and bismuth salts.

"'De Vit-Ol'.—This was a caustic paste—invariably used by the 'cancer cure' quacks—and contained 34 percent of arsenic."

FLUMEBIN.—The Council on Pharmacy and Chemistry has published a preliminary report of Flumerin, the disodium salt of hydroxymercurifluorescein. A report on "Flumerin—A New Mercurial for the Intravenous Treatment of Syphilis"—was read before the Section on Dermatology at the 1922 meeting of the American Medical Association by Edwin C. White,

J. H. Hill, Joseph E. Moore and Hugh H. Young. The authors requested the Council to consider Flumerin with a view to its eventual admission to New and Nonofficial Remedies. The Council examined the evidence presented in the report of Dr. White and his collaborators and agreed with the authors that "the number of cases treated is sufficient to demonstrate that this mercurial is of value, but is too small to permit the allocation of the drug to a definite place in the therapy of syphilis". The American Medical Association's Chemical Laboratory examined the new drug and the tests and standards proposed for its control and reported to the Council that the chemical data appeared satisfactory. The Council reports that the acceptance of Flumerin for New and Nonofficial Remedies must await confirmatory clinical evidence; but because of the fact that Flumerin is a definite chemical substance and because of the evidence in the paper, a trial of it in selected cases may be warranted.—(*Jour. A. M. A.*, Sept. 9, 1922, p. 897.)

SOME ANALYSES FROM NEW HAMPSHIRE.—A recent "Food and Drug Inspection Number" of the *Bulletin of the New Hampshire State Board of Health* contains the following information in regard to the composition of nostrums: Potion Antilaiteuse (N. A. Sirois) consisted of a mixture of Epsom salt and powdered juniper berries. Chipwa Indian Root Blood Purifier (Lucy Royer) consisted of Epsom salt and two or three simple herbs, such as mandrake, spikenard and sarsaparilla. Best Catarrh Remedy (Lucy Royer) consisted of a dilution of tannic acid in glycerin. Nervtone Tablets (A. F. Schambier) contained arsenic and strychnin. Angiolymphe du D'Rous (L'Angiolymphe Laboratory, Dr. P. Roux, Angiers, France).—A tuberculosis cure containing 1.5 percent solution in water of what is almost wholly sugar, with the possibility of the presence of a small amount of some glucoside. Noonan's Hair Petrole (T. Noonan & Sons Co.) contained 17.02 percent of alcohol, salicylic acid and about 12 percent of alcohol, salicylic acid and borax. A La Corbeille Fleurie Eau de Quinine Compound Hair Tonic (Ed. Pinaud) contained 65.75 percent of alcohol and a small amount of quinin. Parker's Hair Balsam (Hiscox Chemical Works) was a strong solution of lead acetate with sulphur. Hay's Hair Health (Philo-Hay Specialties Co.) was a solution of lead acetate with sulphur. Dr. Durand's Acme Hair Rejuvenator (Parisian Hair and Corset Stores) was a solution of lead acetate with sulphur. La Toilette Francaise (Elite Restorer Co.) contained 1.66 percent of alcohol, and was an ammonical solution of silver nitrate. Inecto-Rapid Gray Hair Remedy (Inecto, Inc.) was a hair dye of the two-solution preparations type, having hydrogen peroxid as one solution and paraphenylendiamin for the other. Gillespie Scalp Invigorator (Gillespie Mfg. Co.) contained 20.88 percent of alcohol, together with glycerin, borax and red pepper. Westphal's Auxiliator (Paul Westphal) contained 45 percent of alcohol, glycerin and borax. Woodbury's Combination Hair Tonic (John H. Woodbury) contained 26.59 percent of alcohol, with resorcin. Mme. Fried's Henna (Mme. Fried) consisted of henna or a similar herb with considerable copper and iron salts. Farr's Gray Hair Restorer No. 1 (Brookline Chemical Co.) contained an ammonical solution of silver nitrate. Wyeth's Sage and Sulphur Compound (Wyeth Chemical Co., Inc.) was found to be a solution of lead acetate with sulphur. Ess-Tee-Dee (Smith T. Dustin) was found to be a solution of arsenic with borax. Victor's Antiseptic Liquid Shampoo (T. Noonan & Sons Co.) was found to be essentially a solution of soap. Danderine (Knowlton Danderine Co.) was found to contain 8.77 percent of alcohol, together with salicylic acid and borax. Flora de Lilie Complexion Preparation (Flora de Lilie Co.) was found to be a suspension of bismuth subcarbonate and calcium carbonate with borax. Champlin's Liquid Pearl (Champlin Mfg. Co.) contained 2.35 percent of alcohol and was a suspension of bismuth subcarbonate and calcium carbonate. Cooper's Complexion Beautifier (Cooper & Co.) was a suspension of bismuth subcarbonate and calcium carbonate. Pompeian Hair Massage (Pompeian Mfg. Co.) contained 15.03 percent of alcohol, with arsenic, borax, quinin and capsicum.—(*Jour. A. M. A.*, Sept. 16, 1922, p. 985.)

TETHELIN FAILS.—In 1916, T. Brailsford Robertson isolated from the anterior lobe of the pituitary glands of cattle a substance to which he gave the name of tethelin, and which he regarded as the active growth-controlling principle. Tethelin was hailed as a product capable of accelerating the healing of wounds and promoting recovery after inanition. Now a report has been published of feeding experiments carried out at the Institute of Physiology in University College, London, which failed to point to any influence by the oral administration of the anterior lobe substance on the growth of animals. When the manufacture of tethelin was taken up in 1918 by a pharmaceutical firm, the Council on Pharmacy and Chemistry considered the product. It was found that there was no adequate evidence for its value as a therapeutic agent, and hence the Council postponed definite action on the product until definite evidence had been obtained. Now, however, in part because of the unfavorable report of the English investigation, the Council has concluded the consideration of tethelin and declared it inadmissible to New and Nonofficial Remedies.—(*Jour. A. M. A.*, Sept. 16, 1922, p. 972.)

ANGOSTURA BITTERS.—Newspaper advertisements for Angostura Bitters state that Dr. W. C. Wile, formerly vice-president of the American Medical Association, testified that he used the preparation in his practice. Dr. Wile was fourth vice-president thirty-six years ago. Dr. Wile was in the nostrum business himself and wrote many testimonials. The attitude of the American medical profession toward such activities as those credited to Dr. Wile is entirely different today from that of thirty-six years ago. According to the label, Angostura Bitters is made from pure rum, containing about 45 percent of alcohol.—(*Jour. A. M. A.*, Sept. 23, 1922, p. 106.)

GRAHAM'S NEUTROIDS.—This alleged cure for obesity is put out by one R. Lincoln Graham, M.D., New York City. (Graham claims to be head of "the famous Graham Sanitarium" of New York City, where, it is said, a new method has been discovered by which the obese, though gluttonous and lazy, may reduce without abandoning either gluttony or laziness!) Graham declares that his nostrum contains "no thyroid extract, no free iodids—or harmful drugs of any kind". However, the A. M. A. Chemical Laboratory found Graham's Neutroids tablets to contain impure iodol, 50 percent; magnesium carbonate, 43 percent; starch, 4 percent; talc, 3 percent; and iron, a trace. Iodol is tetra-iodo-pyrrol, which contains nearly 89 percent of iodin. It was formerly described in the U. S. Pharmacopeia. Iodol is distinctly poisonous; even when it is applied externally, poisoning may occur.—(*Jour. A. M. A.*, Sept. 30, 1922, p. 1136.)

INTRODUCING A NEW DRUG.—To what extent are the claims made for a new drug tinctured by commercial considerations, even though put out as the result of investigations carried out by the scientific staff of a firm of standing? And even if the drug is the result of studies carried out by investigators who have no commercial connections there is the question: To what degree has the investigator's enthusiasm tinctured his judgment?

number of physicians abstain from the use of a new drug, until its acceptance for New and Nonofficial Remedies gives assurance that it is worthy of trial. What seems to be an almost ideal method of introducing a new drug has been followed in the case of "Flumerin", the name given to the disodium salt of hydroxymercuri-fluorescein. This drug has been elaborated by White, Hill, Moore and Young of Johns Hopkins. These men have declared the composition of the drug, have reported animal experiments of promise, and have demonstrated its efficiency in clinical trials. The investigators announce, however, that the drug will not be commercially available unless independent clinical study confirms their favorable finding that the drug is of value in the treatment of syphilis. That syphilologists may feel warranted to make such trials, Dr. White and his collaborators requested the Council on Pharmacy and Chemistry to examine the evidence for the preparation. This the Council did, and it has published a preliminary report, stating that the drug is suitable for clinical trial in selected cases. If Flumerin becomes an addition to our *materia medica*, it will be as the result of the orderly procedure: (1) demonstration of its chemical identity and uniformity; (2) animal experiments which give promise of therapeutic value; (3) clinical trials under the auspices of the discoverers, and (4) confirmation of its therapeutic worth by independent clinical investigations. —(*Jour. A. M. A.*, Sept. 30, 1922, p. 1149.)

NEW AND NONOFFICIAL REMEDI ES

STERILE SOLUTION OF MERCURY OXYCYANIDE.—Each ampule contains 5 Cc. of solution, representing 0.008 Gm. (⅛ grain) of mercuric oxycyanide-N. N. R. For a discussion of the actions, uses and dosage of mercuric oxycyanide, see New and Nonofficial Remedies, 1922, p. 192. Gradwohl Laboratories, St. Louis.

LOESER'S INTRAVENOUS SOLUTION OF MERCURY OXYCYANIDE 0.012 GM.—Each ampule contains 5 Cc. of solution, representing 0.012 Gm. (3/16 grain) of mercuric oxycyanide-N. N. R. For a discussion of the actions, uses and dosage of mercuric oxycyanide, see New and Nonofficial Remedies, 1922, p. 192. New York Intravenous Laboratory, New York.

ANTIPNEUMOCOCCIC SERUM (POLYVALENT)-P. D. & Co.—Antipneumococcus Serum (see New and Nonofficial Remedies, 1922, p. 287) prepared from the blood of horses immunized with virulent cultures of pneumococci (Type I, II, III and Group IV) and standardized against Type I culture so as to be of the same strength as Type I serum. Marketed in piston syringes containing 50 Cc., with needle and connections. Parke, Davis & Co., Detroit.

LUMINAL SODIUM TABLETS 1½ GRAINS.—For a discussion of the actions, uses and dosage of luminal, see New and Nonofficial Remedies, 1922, p. 61. Winthrop Chemical Co., Inc., New York.—(*Jour. A. M. A.*, Aug. 19, 1922, p. 628).

POLLEN ANTIGENS-LEDERLE.—Liquids obtained by extracting the dried pollen of plants with a liquid consisting of 67 percent glycerine and 33 percent saturated solution of sodium chlorid. Pollen Antigens-Lederle are marketed in the following forms:

Series A: containing doses 1 to 5, inclusive (2.5, 5, 10, 20 and 25 pollen units, respectively).

Series B: containing doses 6 to 10, inclusive (30, 50, 75, 100 and 150 pollen units, respectively).

Series C: containing doses 11 to 15, inclusive (250, 375, 500, 750 and 1,000 pollen units, respectively).

Complete Series: containing 15 doses.

Diagnostic: containing 1 dose (100 pollen units).

Pollen Antigens-Lederle are employed in the diagnosis and treatment of hay fever (pollenosis). (See New and Nonofficial Remedies, 1922, p. 232). The following preparations have been accepted:

Arizona Ash Pollen Antigen-Lederle: Prepared from the pollen of Arizona Ash (*Fraxinus Toumeyi*).

Arizona Walnut Pollen Antigen-Lederle: Prepared from the pollen of Arizona walnut (*Juglans major*).

Black Walnut Pollen Antigen-Lederle: Prepared from the pollen of black walnut (*Juglans nigra*).

Careless Weed Pollen Antigen-Lederle: Prepared from the pollen of the careless weed (*Amaranthus palmeri*).

Cottonwood Pollen Antigen-Lederle: Prepared from the pollen of cottonwood (*Populus macdougali*).

June Grass Pollen Antigen-Lederle: Prepared from the pollen of June grass (*Poa pratensis*).

Ragweed Pollen Antigen-Lederle: Prepared from the pollen of ragweed (*Ambrosia elatior*).

Red Top Pollen Antigen-Lederle: Prepared from the pollen of red top (*Agrostis palustris*).

Sage Brush Pollen Antigen-Lederle: Prepared from the pollen of sage brush (*Artemisia tridentata*).

Shad Scale Pollen Antigen-Lederle: Prepared from the pollen of shad scale.

Sheep Sorrel Pollen Antigen-Lederle: Prepared from the pollen of sheep sorrel (*Rumex acetosella*).

Slender Ragweed Pollen: Prepared from the pollen of slender ragweed (*Franseria tenuifolia*).

Sweet Vernal Pollen Antigen-Lederle: Prepared from the pollen of sweet vernal (*Anthoxanthum odoratum*).

Timothy Pollen Antigen-Lederle: Prepared from the pollen of timothy (*Phleum pratense*).

ADRENALIN TABLETS No. 2.—Each contains adrenalin (see New and Nonofficial Remedies, 1922, p. 109). 0.00033 Gm. (1/200 grain), as borate, yielding a 1:1000 solution when dissolved in 5 minims of water. Parke, Davis & Co., Detroit.

HYPODERMIC TABLETS ADRENALIN AND COCAIN RX B. (Cylindrical).—Each contains cocaine hydrochlorid, 0.005 Gm. (1/12 grain) and adrenalin (see New and Nonofficial Remedies, 1922, p. 109), 0.00005 Gm. (1/1200 grain). Parke, Davis & Co., Detroit.

BROMETONE CAPSULES, 5 GRAINS.—Each capsule contains brometone (see New and Nonofficial Remedies, 1922, p. 75), 5 grains. Parke, Davis & Co., Detroit.

CORPUS LUTEUM-G. W. C. Co.—The fresh substance from the corpora lutea of the hog, dried, freed from fat, and powdered. For a discussion of the actions and uses of corpus luteum, see New and Nonofficial Remedies, 1922, p. 208, under "Ovary". The product is also marketed in the form of tablets Corpus Luteum, G. W. C. Co., 2 grains. G. W. Carnrick Co., New York.

EPINEPHRIN-LEDERLE.—A brand of epinephrin-N. N. R. made from the suprarenal glands. For the actions, uses and dosage of epinephrin, see New and Nonofficial Remedies, 1922, p. 108. Epinephrin-Lederle is sold in the form of Solution Epinephrin-Lederle, containing epinephrin sulphite equivalent to 1 part of epinephrin in 1,000 parts of physiological solution of sodium chloride, preserved by a small quantity of sulphurous acid and saturated with carbon dioxide. Lederle Antitoxin Laboratories, New York.

HYPODERMIC TABLETS No. 50.—Mercuric Succinimide-Mulford, 0.012 Gm. (1/5 grain) contains mercuric succinimide (see New and Nonofficial Remedies, 1922, p. 194) 0.012 Gm. (1/5 grain). H. K. Mulford Co., Philadelphia.

MERCURIALIZED SERUM No. 2-MULFORD—For Intraspinal Use.—Each package contains the equivalent of 0.0026 Gm. (1/25 grain) of mercuric chloride in 30 Cc. of horse serum. For a discussion of the actions, uses and dosage of mercurialized serum, see New and Nonofficial Remedies, 1922, p. 189). H. K. Mulford Co., Philadelphia.

BILIARY TRACT INFECTION AND ITS DIFFERENTIATION FROM ULCER.*

CHARLES LOUIS MIX, M.D.

CHICAGO

By biliary tract infection I mean generic infection of the biliary tract. The infection may be a common-duct affair which usually is not secondary to gall-stones, or there may be an infection in the cystic duct which may obliterate it and give a much dilated gall-bladder containing a mass of mucus, or there may be an intramural infection of the gall-bladder which may be associated with stones, either cholesterin or calcareous stones. Usually the calcareous stones mean infection. The cholesterin stones are associated with pregnancy, cholesterin in the blood-stream, and similar etiologic factors. Of course there are cases where the infection proceeds still further into the liver with involvement of the hepatic duct and ultimately a cholangitis. When I say "biliary tract infection" I include all these pathologic entities in the generic term because I think that we must first conclude, in studying a given case, that the trouble lies in the biliary tract, and then subsequently determine what part of the biliary tract, by analysis of the case in hand, is infected.

Age has a great deal to do with gall-bladder symptomatology. Usually we find ulcers beginning in the young and biliary tract infection later in life. It is true that gall-stones have been found in babies and in young unmarried and married women, but it is not common for them to occur much before the age of forty. Biliary tract infection if diagnosed before the age of forty must be pretty well fortified by diagnostic arguments if it is to be accepted. The burden of proof is upon the one who insists that biliary tract infection is present in young individuals.

A very important point in the case history of patients with biliary tract infections is the matter of weight. It is a fact that biliary tract infection, as a rule, does not produce emaciation. Every case of ulcer is apt to be associated with the loss of weight,—not necessarily, but I venture to say that 95 per cent. of these cases are associated with such loss. If you recall the ordinary run of patients with biliary tract disease you will agree that they are individuals who are fairly well nourished and past forty years of age. If you recall the patient with peptic ulcer, he is apt to be an under-nourished individual of less than forty. In cases where the ulcer has progressed for any length of time, emaciation is almost invariably present. The emaciation varies with the location of the ulcer. If it is situated in the stomach it produces more loss of weight than if it is located in the duodenum. On the duodenal side of the pylorus an ulcer is usually attended with only about a 10 percent loss. If, for instance, a patient ought to weigh a hundred and fifty pounds, he is apt to weigh one hundred and thirty-five if he has a duodenal ulcer. If the ulcer is in the duodenum, then the weight is apt to be constantly lower than normal. If it is in the stomach the patient is apt to have a fluctuating weight, more or less coinciding with the fluctuations of the ulcer. Ulcers on the lesser curvature side of the stomach produce more emaciation than those on the posterior wall, anterior wall, greater curvature or fundus.

Another important subject for inquiry in getting the history of the individual, besides age and weight, is the periodicity of attacks. No story of infection in the abdomen or of ulcer is complete without reference to the time development of the case. Those individuals who have ulcers of the duodenum always have periodic attacks. They are apt to occur as exacerbations in the spring and fall,—not necessarily, but likely so to occur. Patients with ulcer of the stomach have periods of attack and periods of freedom, but these are usually separated by much longer intervals, sometimes five or six years.

Attacks that occur from infection of the gall-bladder and biliary tract usually are at first associated with long intervals of freedom. A person may have an attack and not have another for two years, then another in one year and

(*) Address in Medicine given before the Section on Medicine of the Indiana State Medical Association, Muncie session, September 29, 1922.

the next in six months, the interval becoming constantly shorter until it may become a continuous performance.

The duration of the attacks is a matter of importance. In ulcer of the stomach the attacks are a matter of weeks. In ulcer of the duodenum the attack is usually a matter of three or four weeks followed by a period of calm. In gall-bladder infections the period of attack is short;—a matter of hours in the early cases, sometimes of two or three days. A person will be taken with a bilious attack and be quite ill, but within forty-eight hours will be back at work. Not so with a patient who has an ulcer of the duodenum. He is grumbling about his symptomatology for a month or six weeks at a time, and will then have a spontaneous remission for a month or two, finally to succumb to another seizure.

Always remember that stress must be laid upon the course of the case, because as you develop the history by questioning the patient it will occur to you that the disease in question is either ulcer or biliary tract infection in most of these abdominal disturbances, just from a consideration of the periodicity of attacks alone.

Very much more important than this matter of periodicity is the matter of pain. Practically all cases of ulcer are associated with pain. Very few of them are latent—very few indeed. There are some ulcers of the stomach which run a latent course, chiefly those with an onset of hemorrhage, but I do not think that you will ever find an ulcer of the duodenum in which latency is present. There are cases of biliary tract infection in which the early incidence of pain is rather infrequent and slight, but almost invariably pain will be present in the story.

There is one great difference between the pain of biliary tract infection and that of ulcer and that is the direction of radiation of the pain. One of the first questions is, "Where do you have the pain and what is its radiation?" As to mere location, the pain in biliary tract infection is not necessarily at the junction of the tenth rib and the costal border. It may be anywhere along the subcostal margin or in the back, but it is almost invariably somewhere in the right upper quadrant. In ulcer cases the pain may be seated in the epigastrium, and sometimes even in gall-bladder cases it is so situated; hence it happens at times that when you inquire into the mere matter of location of the pain you are more or less up in the air so far as coming to a definite conclusion by location alone is concerned, but when you inquire as to the *radiation* of the pain you begin to get valuable information.

In ulcer of the stomach the pain is never radiated into the thorax, whereas in biliary tract affections such radiation is the rule. There is a reason for this, and the explanation is to be found in the relationship of the subdiaphragmatic ganglion. This is a unilateral ganglion, located beneath the right lobe of the liver, and in the transverse fissure, and it is connected with sympathetic nerve fibers plus pneumogastric fibers and phrenic nerve fibers. The phrenic nerve is not merely the motor nerve of the diaphragm. It contains many sensory fibers, some going to the root of the neck, some between the shoulder-blades in the back, some to the right pleura, some to the pericardium, some to the mediastinum, some above and some beneath the diaphragm. Whenever there is irritation from infection of the peritoneum in the transverse fissure of the liver there is apt to be, because of this sympathetic relationship, a reflex pain somewhere in the thorax. Hence, it happens that some attacks of biliary tract infection may be associated with pain in the mediastinum, some with pain between the shoulder-blades, some with pain in the back, neck or chest. Some of the attacks may be thought to be pleurisy in the early stages, but they are really due to disturbance in the biliary tract and are caused by phrenic nerve reflex pain. Many of these infections involving the subdiaphragmatic ganglion are hematogenous in origin, but many of them are borne by lymphatics from disease elsewhere in the abdomen. Thus biliary tract disease may be secondary to ulcer in the region of the pylorus, being borne by the lymphatics, or it may be hematogenous as in typhoid fever.

When I first studied medicine I was either led or permitted to believe that germs had the power of making their way through the down-flowing bile current up into the gall-bladder. This is nonsense since germs have no way of propelling themselves against the descending stream. But just as indigo blue can ascend the lymphatics in the walls of the common duct, floating in the lymph, in precisely the same way germs may make their way by the lymphatics to the transverse fissure of the liver and so affect the subdiaphragmatic ganglion and its component nerve tracts.

With this understanding it is easy to comprehend the direction of the radiation of the pain and the immense aid which it is in diagnosis. In biliary tract infections thoracic radiation of pain is the rule and in ulcer of the stomach or duodenum it does not occur. Of course when biliary tract infection complicates the later stages of ulcer, the history of pain marks its advent. You then have the picture of early pain in the epigastric region followed in later months or years by pain in the territory of distribution of the phrenic nerve supply in the thorax.

There is another important factor concerning pain and that is its type. It may be from either one of two sources: either a peritonitic pain due to pericholecystitis or perigastritis, or it

may be a rhythmic unstriped-muscle fiber pain, due to spastic contraction. It is evident that pain which is due to the rhythmic over-contraction of unstriped muscle fiber may occur in many cases of biliary tract infection, and it is not difficult to pick out a pain of this sort from others. If you ask the patient for a description of the pain he or she can usually well describe the rhythmical contraction of unstriped fibers around the gall-bladder or common duct so that you can distinctly differentiate it from the pain of peritoneal origin, or you may come to the shrewd conclusion that the pain is peritonitic, due to adhesions between the gall-bladder and the duodenum even before the x-ray plates have been prepared.

Of further differential value is the fact that pain due to inflammation of the peritoneum always has associated with it tenderness and soreness on pressure, whereas pain due to unstriped muscle-fiber contractions is relieved by pressure. Thus, again, there is a means of telling what sort of pathologic process is responsible for the pain.

A final matter for inquiry in regard to pain is of importance and that is the time of pain with reference to the time of meals. A pain which comes on at any time, irrespective of meals, is apt to be peritonitic, and of biliary tract origin. A pain due to disease of the stomach, either ulcer or otherwise, or to ulcer of the duodenum, has a time relationship to food. Usually in cases of frank ulcer of the stomach the pain immediately follows the taking of food but that is not true of ulcers on either side of and close to the pylorus. The ulcer close to the pylorus if situated on the gastric side has exactly the same symptomatology as on the duodenal side, and there is no means which I know of by which, from a history of pain alone, one may differentiate ulcer on the gastric side from that on the duodenal side of the pylorus. This is because the pylorus contracts down with a good deal of power on the sore ulcer on either side of the pylorus, and so causes the pain. The pain in duodenal or pyloric ulcer coincides with the empty stomach. As soon as food is put into the stomach it immediately starts through the relaxed pyloric ring; with the relaxation of the pyloric ring, the pain is gone, but as soon as the stomach is empty, two or three hours after a meal, the pyloric sphincter begins to contract down upon the ulcer and the pain begins once more. Invariably in these cases of duodenal ulcer, if something is put into the stomach, even a drink of water, a little bicarbonate of soda or a drink of milk, it will relax the pylorus and stop the pain.

If the ulcer is on the stomach wall the pain appears within half an hour. Its appearance is usually very prompt, and if the ulcer is on the anterior wall it is very prompt indeed. We can now frequently decide clinically as well as by the x-ray plate where the ulcer is located. If it is in the fundus the pain is apt to be prompt and it will last as long as food is in the stomach and is irritating the ulcer. If the patient vomits and the contents are thrown out the pain ceases, but if in the case of a duodenal ulcer the patient should provoke vomiting the pain would begin just so much sooner because the pain is due to contraction. If there is a saddle ulcer involving both sides of the pylorus the pain begins two hours or so after eating.

Such a time relationship is not true of gall-bladder pain. Such pain has no relationship to the taking of food. It may occur at two o'clock in the morning. The first attacks of onset are very apt to be nocturnal. Subsequently they may occur at any time. The patients are absolutely uncertain as to any relationship between the taking of food and the pain and this fact should arouse the suspicion of biliary tract infection.

Another very important topic for inquiry in taking the patient's history is vomiting. Of course it is important to know whether vomiting is present or absent and if present it is very important to know all about it. Does it take place promptly after a meal? Or does it occur remotely after a meal? Does it take place once or twice? Does it cease after expulsion of food or does it continue? If it continues does it lead to vomiting of bile? If so, how long does it last? Are there six, seven, eight or nine attacks of vomiting or just one? A great deal depends upon the answer to these questions. In ulcers of the stomach the patient stops vomiting as soon as the contents are out. The reason is obvious; as soon as the food is out the patient is relieved. You have the same thing in carcinoma of the stomach—the stomach contents are expelled and the patient is easier. Such vomiting is a defense symptom.

In case of an ulcer on the gastric side of and close to the pylorus vomiting does not take place. If there is food in the stomach the patient is comfortable for then the pyloric sphincter is relaxed and does not pinch the ulcer. Such a patient gets to be a night feeder, with a glass of milk at his bedside so that he may take it during the night. It would be a very foolish thing on the part of Nature to dump the food out in these cases. The thing to do is to keep food there and the pylorus relaxed. Hence in an ulcer in this location absence of vomiting actually aids the patient. Never in a case of pure, uncomplicated ulcer of the pylorus does vomiting take place. If it does occur it is because there is peritonitis, and then reflex vomiting may, of course, occur.

If the ulcer is on the lesser curvature vomiting is extremely common and practically the rule, the reason being that ulcer on the lesser curvature is located at the maximum development of the nerve supply, a place where reflex

vomiting is most apt to take place. The patient with ulcer of the greater curvature will not vomit much. The law of vomiting in lesser curvature ulcers was illustrated in the case of a man thirty-four years of age who had a gastrojejunostomy done last Thursday. He vomited a great deal, such vomiting suggesting lesser curvature ulcer, and when he had his fluoroscopic examination we thought we saw the ulcer at the lesser curvature and at operation we found a large ulcer on the lesser curvature close to the pylorus. The gastrojejunostomy had to be done because he had a gastric retention. The frequency of the vomiting in his case led to the conclusion that the gastric ulcer must be on the lesser curvature.

Patients with biliary tract infection may have vomiting or they may not. If vomiting is present it is always of food first and then bile. If you think of a patient with gastric ulcer, does he vomit bile? No. He vomits food first and then he stops, unless there be an added associated peritonitic symptomatology. The biliary tract patient vomits six or seven times, or maybe more, and he always ends by vomiting bile. Like the patient with a tabetic crisis, he has a series of vomitings and toward the end nothing but bile comes up. I am of the opinion—I may be wrong, and will cheerfully say I may be—that the vomiting is after all a reflex anastalsis in the duodenum, due to a disturbance of the law of reciprocal innervation, whereby bile passes backward through the pylorus into the stomach where it acts as an emetic just as does ox gall, and causes repeated vomiting of bile. Of course, there are those who say that you can short-circuit the bile-duct and conduct bile right into the stomach and not get vomiting. Perhaps the argument is valid. Yet, I believe it is a reflex peritonitic disturbance which leads to the vomiting, and I think there is always in this group of cases a reversed duodenal anastalsis, sweeping bile into the stomach, and causing repeated emesis.

Some facts in patients with abnormal pyloric rings are interesting. Occasionally you encounter patients with biliary tract infection who show gastric anacidity. Most patients with biliary tract infection show hyperacidity when you make the Rehfuss test, but in some patients with biliary tract infection alkalin duodenal contents without bile regurgitate into the stomach, neutralizing the acid, and so causing anacidity. I saw a case just the other day in which I am sure that the anacidity was entirely due to a widely relaxed pyloric ring. Even five hours after the meal there was evidence that the duodenal contents were regurgitating into the stomach and producing neutralization of the hydrochloric acid.

Of very great differential value is the question of general infection. An ulcer of the stomach is an end-result or end-product of infection. A gall-bladder infection is very different. What is the history, for example, in a patient suffering from ulcer of the stomach and duodenum? Never, in these cases, do we get a history of coated tongue, headache, chills and chilly sensations, arthritis, neuritis, febrile attacks, or an increase of the leukocytes. In the biliary tract infections some of these conditions are always present. In a given case of disease of the right upper abdominal quadrant when you ask yourself, "Is it a case of infection or not?," you are really asking yourself, "Is it biliary tract infection or is it not?"

In a patient with ulcer headache is the exception. You do not find the coated tongue but the clean tongue—the hyperacid tongue which many clinicians have noted. Such patients are not subject to arthritis unless they have some other source of infection. They are not subject to neuritic pains and febrile seizures; they do not have attacks associated with chilly sensations or with rigors. You never find the temperature above normal. You never find an increase of the white cells when you make the leukocyte count. These things come only in biliary tract infections. It frequently happens that one is able to make a diagnosis by these considerations alone. I recall the case of a woman treated by a very prominent physician in Buffalo some years ago for ulcer of the stomach. She had an infection of the gall-bladder which was operated upon and cured and the diagnosis was based upon signs of infection and particularly an infectious headache. When carefully questioned she recalled symptoms which she had not reported to any physician previously because her attention had not been directed to them.

There are many cases in which the whole symptomatology may be reflex and gastric and it is difficult for one to make out the differential diagnosis in such cases, but if you can discover evidences of focal infection, you are readily rewarded in the diagnosis.

Of course, the laboratory helps much in these cases. It is your duty in every case of disease of the stomach to find out as much as possible by laboratory methods. My method is the Rehfuss, not the old Ewald method, for I think the latter is inadequate. If you pass a Rehfuss tube and get eight or ten specimens collected at half-hour intervals and examine them carefully you will obtain a set of findings from the stomach which are of great importance. Of course, we expect a hyperacidity in most cases of ulcer of the stomach and in most cases of infection of the biliary tract, but not necessarily so in the latter.

Very important also, and we never omit it, is the careful examination by the x-ray because you will obtain by the x-ray, as a rule, confirmation of the clinical diagnosis if the examination

is carefully made. I am one of those who believe that the physician should be present at every fluoroscopic examination of his patients. He need not be there when the plates are made, but he should watch the barium making its way into the stomach and out through the pylorus, and should have a very good general idea of what is going on in the stomach and upper part of the abdomen at the time of the fluoroscopic examination. You cannot describe things by word of mouth, and seeing it yourself is worth much more than many reports. Then after the plates are made, the immediate, the half-hour and the five-hour plates, you can inspect them and compare them with what you saw in the clinical examination.

Is the physical examination of much importance? Not really very much. But you have to differentiate these diseases from others in the right upper abdominal quadrant. As a rule, ulcer of the stomach and biliary tract infection are not associated with palpable findings. There is only a tenderness and slight soreness in the region of the morbid process. Ulcer of the stomach is usually associated with an area the size of a quarter or a half dollar, sometimes an area as small as a dime, and that tender area locates the ulcer. Ulcers of the duodenum present a larger area of tenderness which lies to the right of the midline and above the umbilicus. Patients with biliary tract infection show tenderness and soreness, usually close beneath the right costal margin. It is not fair to press your fingers deep into the abdomen, and then, because he winces, say that he has an infected gall-bladder. I would not wish a physician to press too vigorously my right subcostal area, because he would doubtless hurt me, and then I might be suspected of having some gall-bladder infection. Always be fair in the examination. When you make pressure on one side press equally on the other—"Where is the pain?" "Is it more intense on one side than on the other?" "Is it only on one side?"

If you decide upon a diagnosis of biliary tract infection it may be one of many things. It may be a morbid process located within the gall-bladder or it may be an intramural cholecystitis. Many patients with biliary tract infection present symptoms which have come on abruptly. Such patients with acute symptoms coming on within a few hours may have to be hurried to the hospital for examination and eventual operation. Chronic cases of gall-bladder infection may or may not be associated with gall-stones. Sometimes the x-ray, as in the beautiful collection of plates which Dr. Kirklin has here on exhibition, will show the stones or it will show the outline of the gall-bladder with adhesions to the somewhat distorted duodenum. Sometimes the gall-bladder shadow is itself distorted by reason of such adhesions, and the duodenal cap is frequently distorted by traction. In many instances you may be wholly unable to say whether the cholecystitis is or is not associated with cholelithiasis. Dependent upon the type and degree of infection, is a possible decision to treat the case surgically or medically.

I do not believe in gall-bladder drainage, certainly not by the oral method and usually not by the surgical method. If drainage alone is done it does not give good end-results. The patient after any but a very prolonged surgical drainage is within two or three years much the same as when first operated upon. For this reason cholecystectomy has come into general use rather than cholecystotomy, and many surgeons will not drain the gall-bladder because it will not give relief sufficient to warrant its adoption as a standard operation.

There are certain places where stones in combination with infection produce very spectacular results. When infected stones are at the neck of the gall-bladder they may produce a very typical fever which was described by Charcot and is known as the "angular fever of Charcot". If anywhere in the body there is a point where a great deal of infectious material can be poured into the blood-stream within a short time the effect is comparable to a catheter chill or to the chill following the introduction of vaccine into a vein. There is a very abrupt and usually a high rise in temperature. Wherever infection is suddenly introduced into the blood, as in the case of the corpus spongiosum from urethral catheterization, or in the thrombosis of veins in Peyer's patches in typhoid fever previous to hemorrhage, or in stones associated with traumatization and infection of the rich network of lymphatics at the neck of the gall-bladder, there is a very sudden rise in temperature, and a very sudden drop. The rise may start at noon time and run to 103 degrees F. and be normal at six o'clock. This "angular fever of Charcot", found in these gall-bladder infections, is almost pathognomonic of infection of the *neck* of the gall-bladder, so that we are able to formulate the conclusion at times of a stone in the neck of the gall-bladder with purulent infection.

If the infection of the gall-bladder be an abscess with blockade of the cystic duct, so that the stone is imprisoned, there are signs of sepsis with a large gall-bladder, denoting empyema. In these cases there is added to the biliary tract symptomatology with all the signs of sepsis with definite enlargement of the gall-bladder. Enlargement alone, without sepsis, may indicate merely hydrops of the gall-bladder.

I have said what I wished mainly to say, namely, that in general if one pays attention to the facts of age, weight, periodicity, pain, its location and radiation, its character—as to whether peritoneal or caused by unstriped muscle spasm; vomiting, its character and its association with bile, the time of vomiting, the matter of examination of the stomach contents by

the Rehfuss test meal and all the x-ray examinations, and above all to the collateral evidence of infection—if, as I say, we pay attention to all of these things, we shall be able to differentiate the great bulk of our cases, both gastric and duodenal, from biliary tract infection in general. Of course, the higher our percentage of successes with this differentiation, the better for the patients because we shall not be led to do wrong things. We shall not be putting gall-bladder cases upon an ulcer diet, which is so frequently done time after time, especially in those cases of biliary tract disease in which the gastric symptoms are paramount. The most important differential point which I can mention as differentiating between ulcer and biliary tract infection is the question of infection—headache, arthritis, neuritis, fever, chilly sensations, leukocytosis, and coated tongue as distinguished from the red, acid tongue of ulcer.

CONGENITAL PYLORIC STENOSIS*

O. G. PFAFF, M.D.
INDIANAPOLIS

In this brief presentation I cannot discuss at length the nature of congenital pyloric stenosis, nor the related condition known as pylorospasm. That this condition occurs with much more frequency than was formerly believed is undoubtedly shown by the experience of pediatricians in large clinics, and in private practice; we know that this condition is actually congenital inasmuch as well marked instances have been found in the unborn fetus, even as early as the seventh month of gestation.

Until recent years the condition when recognized was regarded as little more than a calamitous curiosity. An occasional case was operated on with discouraging mortality, until the genius of Fredet and Rammstedt devised the procedure which bears their names, and which has placed us in firm control of this heretofore fatal malady.

Without referring to the ultimate etiology, we have to deal with a condition of actual obstruction due to an enormous hypertrophy of the pyloric sphincter. This hypertrophy, of fetal origin, progresses with more rapidity after birth as a result of the institution of normal feeding which increases muscular activity with its concomitant hypernutrition and the resultant great thickening of the muscular ring.

The symptoms of obstruction rarely begin before the tenth day and more frequently in the third week of life; some cases not manifesting themselves until as late as two months.

The onset is usually quite sudden; the vomiting of food is uncontrollable, persistent, and projectile in type; the stomach contents being violently discharged to the distance of from one to three feet or more. Preceding the vomiting there are persistent peristaltic waves (which are plainly visible) evincing the attempts of the stomach to overcome the obstruction. These waves flow from left to right and follow almost immediately the ingestion of food, and are in turn directly followed by the characteristic projectile vomiting. Constipation is marked. From the onset of these characteristic symptoms there is a rapid loss in body weight from food and fluid starvation, and the inevitable tendency is towards death.

The diagnosis is not difficult. The projectile vomiting coming on at the characteristic time, and persisting (in spite of the administration of atropine, which appears to be a panacea for uncomplicated pylorospasm), is enough; but in addition to these conclusive signs there is a small tumor in the upper right quadrant which can be very plainly palpated in many but not all cases. The diagnosis once made, no time should be lost. The child's vitality should be conserved by immediate action which in itself is no heroic ordeal. The Rammstedt operation is both simple and safe and the results ideal. Ether is advocated by some surgeons and I used it in one case, however the free injection of one-half percent novocaine is thoroughly satisfactory and is certainly safer. The abdomen is opened by a two-inch incision to the right and above the umbilicus; the pylorus is drawn into the wound and the thickened muscle which forms a tumor much the size and shape of an olive is grasped by the thumb and index finger of the left hand. Choosing the most avascular area, a longitudinal incision is made through the peritoneum and the hypertrophied muscular fibres down to the delicate pale submucosa, which must be approached with great care, as wounding the mucosa is a complication which may well be disastrous. Much stress has been laid upon the importance of spreading the sides of the pyloric incision by means of forceps so that the mucosa shall bulge well up between the walls of the cut. However, I believe that if the muscular fibres are carefully and completely separated by clean, accurate incision, spreading the walls of the cut is not necessary. When a sphincter muscle is divided there ensues a contraction of both cut ends towards the middle which invariably spreads the gap. I relied on this principle in the cases which were referred to me and the results have strengthened this belief. The remaining step in the operation is the careful closure of the abdomen by layer sutures, reinforced by silk-worm gut, and adhesive strips.

I will offer a brief report of four typical cases occurring in the practice of Dr. Jas. C. Carter, upon which I did the Rammstedt operation, which was followed in each case by a prompt recovery with a complete cure of all symptoms.

(*) Presented before the Surgical Section of the Indiana State Medical Association at the Muncie session, September, 1922.

Case 1—G. A. K., weighed 7 pounds at birth; no serious disturbance for two weeks, when violent vomiting after meals began and persisted with regularity. It was of the projectile type and was preceded by well marked peristaltic waves from left to right; loss of weight was promptly manifest until the baby weighed 4½ pounds. A small tumor could be felt above and to the right of the umbilicus. Pyloric stenosis was diagnosed and under ether the Rammstedt operation was performed. The relief was immediate. Some occasional vomiting occurred which I explained on the theory that a few muscular fibers had been left which constricted the pylorus, until they gave way under the much stronger contraction of the divided pyloric strands of muscle. The improvement was rapid and steady; in three months it weighed 10 pounds and in 5 months later it weighed 19 pounds 9 ounces and has since then become a big healthy infant.

Case 2—H. H., male, born Sept. 17, 1921, birth weight not noted; no serious disturbances until the beginning of the second month, when it began to vomit after feeding, at first in moderate amounts, which progressively increased in spite of atropine. Constipation was pronounced; the vomiting assumed the projectile type; the peristaltic waves after feeding were marked. On Nov. 1st the weight was 12 pounds and by Nov. 11th it had decreased to 9 pounds. Consent to operation was given and under novocaine the Rammstedt was performed. The vomiting and other untoward symptoms at once disappeared and the child began to gain in weight at the rate of approximately 7 ounces a week, so that at the end of seven months it weighed 19 pounds and has continued further normal increase since that time.

Case 3—H. W. L., male, born Feb. 13, 1922. When three weeks old began to vomit after feeding and was treated six weeks with various artificial foods after having been weaned. The weight dropped from 12 to less than 7 pounds; the projectile vomiting, peristalsis, constipation, etc., established the diagnosis. The emaciation was extreme, the infant appearing to be little more than a living skeleton. It seemed to be almost a hopeless case and the mother strongly objected to an operation but eventually consented as a last resort. A Rammstedt was done under novocaine on April 27th. During the ensuing 36 hours there were a few spells of moderate vomiting and it then ceased entirely. The gain in weight began at once, and I received a letter from the family physician, dated Aug. 28th, just four months after the operation, stating that the baby now weighs 16½ pounds, a gain of 10½ pounds.

Case 4—S. W., male, born April 14, 1922, birth weight 9 pounds 12 ounces. At the end of the third week it began to vomit violently after feeding and was very constipated; the characteristic peristalsis was plainly visible and the small tumor was felt in the right upper quadrant. On May 22d the weight had decreased to 7 pounds 12 ounces, a loss of two pounds. The Rammstedt was done and the baby was taken home two days later and made a rapid and complete recovery and is now a hearty, well developed infant.

In closing this brief presentation of such an important subject, I will summarize by calling attention to four points:

1st.—These cases occur with more frequency than is generally believed, probably the most of them being overlooked.

2nd.—The diagnosis is not difficult.

3rd.—The treatment is surgical.

4th.—The Rammstedt operation is simple, safe, and the results are brilliant, gratifying and permanent.

DISCUSSION

DR. JAMES C. CARTER (Indianapolis): Please do not gather from what Dr. Pfaff has said that all vomiting babies have pyloric stenosis, and please if you do suspect pyloric stenosis do not take them off the breast. In so doing you have lost the best therapeutic agent for recovery that you have had, that is, the best therapeutic agent after the operation. Every baby spits up more or less. That is not vomiting. In the pyloric stenosis cases the vomiting is of the projectile type, as Dr. Pfaff stated, and the youngster frequently throws food three or four feet. Ordinary vomiting is due to over-feeding and can easily be corrected by reducing the time of nourishment or the amount of food which is given if he is on artificial diet. If you suspect stenosis in any given case I would strongly advise that you take the time to see the baby fed and that you see it fed when it is stripped. You cannot diagnose pyloric stenosis with two or three layers of napkin, a shirt and a dress. If you feed the baby and then watch the abdomen you will see the waves. The men who have written the most about this subject tell you that you can feel the tumor itself in every instance. I do not believe this is true. You may find the tumor mass if you look long enough.

The constipation that is associated with pyloric stenosis is very marked. It indicates the decreased amount of food that is going through and that is one of the important points of the diagnosis. It has been my pleasure to see nine cases, one of which may have been a pylorospasm. Seven of these cases were operated upon and five of them are alive. There is one case of pylorospasm that may have been pyloric stenosis that was not operated and when not operated died. The child was under my care at the time and we were using atropin treatment and were getting results, an increase in weight and so on, but one morning—I don't know whether I had some baleful influence or

not—while I was standing beside the bed looking at it the child proceeded to die right then and there.

The treatment other than surgical which is of most benefit is, first the use of atropin in 1 to 1000 solution. You can safely give up to fifteen drops of such solution preceding feeding without getting any flushing of the face or excessive dryness, although you work up to this one drop at a time.

If you have a true pylorospasm and no stenosis you will get benefit from this method. You will not cure the vomiting but will get enough food through to get an increase in weight and general benefit.

The feeding of thick cereal has been much written about, as was advocated by Sauer of Evanston, and he gets results, but he gets results because he lays down this rule which he never deviates from, that when the baby has lost one-fourth of its birth weight then it is operated, and that rule holds absolutely good. Otherwise, you will have a youngster that nothing will bring back.

Dr. Pfaff neglected to say in his paper that the essential point of the operation is speed, in getting in and getting out. We must avoid shock and not take everything out of the abdomen and have a look. We must get in and out as speedily as is consistent with good operating. Do the operating and then quit.

Another important thing is the restoration of body fluid. In the four cases Dr. Pfaff operated for me we filled the abdomen with salt solution and then put the baby back to bed with a glucose drip. We started the feeding as soon after the operation as we thought practical. The feeding cannot be told about in advance, and we feed them until we get up to what we think proper to get our increase in weight.

DR. W. D. GATCH (Indianapolis): As has been emphasized, there are two classes of cases for which a surgeon may be consulted: the simple pylorospasm and the cases of true hypertrophy of the pylorus. While there might be a mistake clinically about which class you are dealing with, there can be no mistake after the abdomen is once opened, because one of these hypertrophic cases presents a mass of gristle-like cartilage as large as your thumb. Whatever results may be reported from medical treatment, it is hard for anyone who has seen one of these cases to believe that anything short of dividing this thick mass could bring about relief of the symptoms.

I think Dr. Pfaff's excellent results have been procured by his sticking to the proper kind of case. They have all been of the hypertrophic class. I think it is a question whether we should operate on a simple pylorospasm. The results in such cases are very different and apt to be questionable. I know I lost one case of the spastic variety and would hesitate to operate on one of that kind again.

I speak of the differential diagnosis between the two types of obstruction in all modesty, as one who is not a specialist in the diseases of children. In the cases of true hypertrophy which I have observed the distension has been limited to the upper portion of the abdomen. The intestines have been empty. In the cases of pylorospasm there has been distension of the intestines. Whether this holds true in all cases I do not know.

I am glad that Dr. Pfaff emphasized the fact that he cuts down to the submucosa and no farther. In a good deal of the literature the statement is made that the incision is carried to the mucosa. If you do that you get into the bowel. The submucous coat is the only layer of the bowel that has any strength. The mucosa and muscularis are friable, but the submucous coat is a strong one. Some think it is terrible to leave nothing but this membrane between the child and destruction, but as a matter of fact you weaken the bowel in this operation very little. Experiments have shown that in infants this will stand a pressure of sixteen pounds.

There are two or three points in the technic that are interesting. In my own experience I have had more trouble in closing the abdominal wall than in doing the operation on the stomach itself. The wall is so thin that you are in constant danger of wounding something. I think one of the dangers after operation is evisceration. That can be avoided by making the incision very high, so that when you close the abdomen the large liver of the child will come down behind and keep the intestines from pushing out. I think this is a valuable point.

I have attempted once or twice to close over the pyloric incision with omentum or something else, but it is very difficult. There is very little to close over and it seems to be unnecessary. The adhesions that form there do very little harm. I am informed that some of these cases have recovered and have later come to autopsy from another cause, and it has been discovered that the enormous mass of gristle-like cartilage has disappeared.

DR. LOUIS H. SEGAR (Indianapolis): I believe Dr. Gatch has sounded a worthy word of warning, insofar as the diagnosis of congenital stenosis is concerned. Dr. Pfaff said the diagnosis was easy. The open-and-shut case of congenital pyloric stenosis is easy, where you have projectile vomiting, visible peristalsis, starvation stools, emaciation, progressive loss of weight and palpable tumor. There you have an obvious case for surgical interference, but a good many of the babies that one sees with projectile vomiting, and with visible peristalsis, with loss of weight and starvation stools, are not cases of

pyloric stenosis. Those cases sometimes go to the surgeon but the result is in a good many instances distressing. Great care should be taken in the differential diagnosis between pyloric stenosis and pylorospasm. The baby, from the clinical standpoint, presents just the same clinical symptoms in the one instance as in the other. The roentgenogram does not help. Watching the baby's peristaltic waves through the abdominal wall does not help. There is only one way in which you can make an absolutely definite diagnosis between spasm and hypertrophy, and that is to feel the tumor. As Dr. Carter aptly said, many times you cannot feel the tumor. Then what shall you do? You have a little wiggling, crying baby to examine, and if you can stop this wiggling and crying you can find the tumor more easily. You can do this by means of a general anesthetic. Three times I have put a baby under general anesthesia and it has been possible to feel a tumor that was not otherwise palpable.

There is one thing that must be considered in making a diagnosis of congenital pyloric stenosis with the idea of operating, and that is whether the stenosis is complete or incomplete. Dr. Sauer has been unusually successful in the treatment of pyloric stenosis which was not a complete obstruction, by the use of thick cereal feeding, by mixing farina with breast milk and feeding that with a spatula or some other instrument. If the obstruction is incomplete the babies do well and do not need surgery.

The diagnosis is not always easy. It sometimes requires anesthesia to feel the tumor, and if the obstruction is not complete the case is not surgical.

DR. O. G. PFAFF (closing): I believe the matter of diagnosis is not so difficult after all. I think all cases of persistent projectile vomiting which are due to pylorospasm and not to stenosis will yield to the use of atropin—or nearly every case. If they do not yield to atropin and the patient continues to lose weight, I believe when a loss of 25 percent is reached they should be operated. When it is due to pylorospasm I believe there is a defect in the muscle, and the spasm is possible because of this defect. I think if the muscles are divided in such a case we have every right to believe that they will not obstruct and that we have a cured case, even if it is not an organic hypertrophy.

Months or years after these operations some children have died from other causes, and when a postmortem has been held in a few instances, as Dr. Gatch mentioned, they have shown a disappearance of the tumor and almost complete disappearance of the scar.

As to closure, it is sometimes difficult, but I think we should take enough time to close these little fellows up as we do any abdominal case, getting the muscle and fascia together with catgut, then the skin with silkworm gut sutures placed far enough from the margins and left in position long enough to get a complete healing.

EPIDEMIC ENCEPHALITIS AFTER-EFFECTS*

W. A. FANKBONER, M.D.
MARION, INDIANA

The mortality of epidemic encephalitis is around 20 percent. Maybe one-third of the survivors recover in from six to twenty-four months. The other two-thirds show either a persistence of troublesome symptoms or some type of organic after-effects. These conditions vary through the scale of physical and psychic abnormalities, from a slight tic to an extensive paralysis; from mental hebetude to insanity.

The most serious lesions occur in the brain stem, the pons and medulla. The gross pathological features are congestion, edema, hemorrhages, petechial and larger, and a doughy consistency of brain tissue. Microscopically the small hemorrhages are shown as more numerous. There is cellular infiltration of the adventitia of the smaller vessels, perivascular exudation, a dense perivascular cellular infiltration, a more sparse cellular infiltration of the white matter; at times evidence of destructive action even into the nuclear areas, sometimes the evidence of connective tissue proliferation, and sometimes the evidence of a reconstructive effort.

The damaging effects of the disease can be appreciated properly only when we keep in mind the character of the pathology and the area of its greater intensity. Congestion, edema, extravasation, infiltration and hemorrhage are all pressure factors. Fibrous tissue is also a pressure factor, but of a different nature from those mentioned, and producing its effect later. Toxine effect is primarily one of chemical irritation. Out of all these factors may arise a confusing array of symptoms, from a diagnostic point of view, and from a failure of resolution most disastrous after-effects may occur.

From current literature at my command I make the following abstracted references:

One report on 75 cases six months after an epidemic. In a general way these patients complained of general weakness, lack of energy and initiative, some headache or sense of fullness in the head, mental dullness and lack of power of concentration, and showed delusions and mental deterioration. There occurred motor disturbances manifest by local spasm, choreiform movements, partial pareses in the oculo-motor area and optic nerve weakness, general convulsions

(*) Presented without reading before the Section on Medicine of the Indiana State Medical Association at the Muncie session, September, 1922.

and hemiplegia. In some cases paralysis agitans symptoms appeared, and these were the most persistent.

A report on 92 cases, one to three years after the acute attack, shows about 9 percent fully recovered and 15 percent not fully recovered but able to work. Of this 15 percent, ten patients had residual cranial nerve symptoms, four had tremor of the tongue and extremities, and all had insomnia, irritability, depression or headache. Two of the whole series were stationary. Of the total 66 percent were in a serious condition. Forty-two of these, almost half of the total series, were of the paralysis agitans type. The remaining twenty were slowly progressive, showing various manifestations.

A report on 78 cases, six to eighteen months after the acute attack, shows a mortality and a recovery of about 25 percent each. Among the other 50 percent there was exhibited a variety of manifestations embracing asthenia, both mental and physical, with much retarded processes in both fields of activity; mental disturbance, some to the condition of insanity; insomnia; partial unilateral facial paralysis; tremors of the face and tongue; clonic rythmic contractions of the muscles of mastication; epileptiform convulsions, hemiplegia and paralysis agitans symptoms.

A report on 145 cases, 90 of which were acute with a death rate of 26 percent. The surviving acute cases with 55 chronic cases in the series makes 115 cases for study of after-effects. Of these about one-third were considered well. The other two-thirds exhibited asthenia, myoclonic phenomena and twitchings, neurasthenia and psychasthenia, psychoses resembling dementia præcox, ophthalmoplegia, difficulty in swallowing and trembling about the lips and tongue, and paralysis agitans symptoms. Two patients developed a glycosuria likely due to irritation at the fourth ventricle.

I report on personal information the following ten cases:

Case 1. Mr. S., age 34. Came to my office Jan. 22, 1921. General attitude and expression one of unusual fatigue. For a few days had been seeing double. Five days previously a slight nausea one day, not persistent. For a week unusually fatigued. There was no pain at this time and was not during his whole illness. Confined to bed two months. Took no solid food for seven weeks—could not masticate and swallowed liquids with great difficulty. For six weeks could not articulate, and most of the time made no sound whatever. For ten weeks could not change position of the body. There was a marked persistent general spasticity. Twelve weeks from the beginning of his illness he could manage to walk, showing some spasticity.

His general symptoms in order of incidence were nausea, weakness, drowsiness, lethargy, shivers during the second week, of sufficient intensity to shake the bed, and spasticity. There appeared early, ophthalmoplegia and expressionless face. A little later general spasticity, coarse tremors, increased heart and respiratory rate. His respiration was nasal and somewhat noisy on account of spastic closure of the mouth. He seemed entirely oblivious to his environment, was aroused only by insistent sharp urging, opening the eyes slightly and immediately lapsing into lethargy. His motor symptoms ran the whole gamut of the cranial nerves and into the long tracts of the arms and legs. His mental symptoms were only a slight delirium during the second and third weeks.

There was not a complete paralysis of any function. General spastictiy was a persistent feature. Applied effort at passive motion was resisted. The teeth were set. The legs were in constantly slight flexed position. The arms were kept in a repose position across the chest in a spastic state, with the wrists and fingers slightly flexed. If the arm were lifted away from the chest by an attendant it retained the flexed position and would remain away from the body until replaced by the attendant. Any motion that might be attempted by the patient was attended by a marked aggravation of the coarse tremor.

In four and a half months from the beginning of his illness he was able to begin light work, gradually doing more, and has worked continuously since. He tires more easily than before his illness and lacks initiative and power of concentration. In a general way he is physically well and is mentally clear. The only patent thing left eighteen months after the beginning of his illness is a slight unilateral tic at one corner of the mouth.

Case 2, Mr. L., age 36. Encephalitis, December, 1919. First three days hallucination and insomnia. For the next five weeks mildly lethargic but able to keep at work as shipping clerk in a paper house, at times walking into objects or against the wall. Later insomnia developed and from lack of endurance and loss of power of concentration he had to quit work. He came to me in March, 1921. The insomnia has persisted to the present time. He never sleeps more than three hours at a time and that infrequently. He goes to bed and rests without any pain or distress. He is mentally clear. About three months ago he tried to work where his duty was to take a miscellaneous lot of small machine parts and put them in boxes, each kind in a separate box. He would get them mixed and had to quit. At present he is night watching in a small factory and tells me he has a feeling of uncertainty as to his doing the work right. There are no pains, twitchings

or spasticities. He carries his right arm in the position of a paralysis agitans, but there are no tremors and he has good use of the arm. There is a slight tremor in the right cheek. He has good use of his whole body, but motion is very much slower than normal, sometimes a suggestion of a shuffle in the walk. His general appearance is one of dejection.

Case 3, Mr. W., age 35. No premonitory symptoms. A mild persistent ptosis, with weakness and lethargy, and no other manifestations. He could be easily aroused but immediately went off into lethargy and remained so for one month night and day. There was an uneventful complete recovery.

Case 4, Mr. M., age 19, was seen in consultation with Dr. Hawkins, Swayzee, Indiana. The case at the time was acutely toxic. The temperature had been 103, but had fallen to 100. He did not seem seriously ill, had a mild broken delirium and insomnia. When approached in conversation was rational. Later lethargy developed. He made a complete recovery, but it was six months before he could do a day's work without undue fatigue. During convalescence there was much eye fatigue which he attempted to correct with glasses without results. The eyes came right with the general condition.

Case 5, Mr. M., age 50, seen with Dr. Hawkins. This case presented a very early paralysis agitans condition of a very marked type. There were no prodromata or early suggestive symptoms of a lethargic type of encephalitis. Was this a case of epidemic encephalitis not giving rise to the early characteristic symptoms? The patient died early in the illness.

Case 6, Miss X., age 30, seen in consultation with Dr. Newell of Converse, Indiana. This case was of the meningeal type. There was ptosis and diplopia. Severe pains occurred in the head, neck and shoulders. There was a constant broken delirium. Death occurred early.

Case 7, Miss Y., age 21, reported to me by Dr. Erle Daniels, Marion. First week vomiting three days, beginning headache which became progressively worse. At the end of this week diplopia. During the second week cramps in the legs, delirium, lethargy, spasms of the muscles of the neck and some shivering attacks. Right side of face somewhat flattened out and complete ptosis of right eye. There was later difficulty in swallowing. This case was of the meningeal type. Death occurred early,—in two weeks.

Case 8, Mr. McA., age 44, reported by Dr. E. O. Harrold, Marion. This was an ambulatory case showing the classic features of asthenia, weakness, lassitude, mental sluggishness and lethargy. There was diplopia and moderate ptosis but no other localizing symptoms. The initial symptoms appeared early in March, 1922. He now complains of dullness of vision, constant drowsiness, immediate fatigue on moderate exertion or excitement, little initiative and less endurance. In a general way he appears well. Mental processes are slowed down. He has lack of interest, enthusiasm and concentration. He conducts his business but by forced effort. In his words, he feels like he had "a sack of cement on his head".

Case 9, Mr. T., age 16, reported by Dr. Frank Brown, Lafontaine, Indiana. This case had early naso-pharyngeal catarrhal symptoms. He thought he had "something the matter with the eyes" and before seeing his family physician consulted an oculist. The early general symptoms simulated typhoid fever. There was a little later, diplopia, ptosis and a lethargy lasting three weeks. There was general spasticity during three weeks. The convalescence extended over two months with complete recovery.

Case 10, Mr. T., age 18, reported by Dr. Brown, presented much the same characteristics as case 9, and came to complete recovery.

The following nine cases are at the Marion National Sanitorium. I was given access to these cases and their histories through the kindness of Dr. Wm. MacLake, medical director and superintendent. I wish to acknowledge also other courtesies extended by Drs. Gilfillan, Murray and Cook of the sanitorium staff.

May I digress for a moment to state that the Marion National Sanitorium accepts only mental and nervous cases occurring among soldiers of the Spanish-American and World wars. Ninety percent of its over 800 patients at present are World war veterans. The institution is complete in every facility, embracing all necessary laboratories, excellent well directed equipment for the therapeutic application of electricity, baths and vocational training. It has a capacity for 1,094 patients. The personnel of the staff embraces thirteen physicians, each a specialist in his line of work, and three dentists.

With these cases I mention but little of their history and describe somewhat briefly their present condition.

Case 11, Mr. K., age 33, dull, apathetic, mask-like expression, stands with stooping posture, head forward, arms and hands partially flexed; will sit for hours with hands on chair arms, seldom moving his head, will answer questions slowly—sometimes the effort to answer is attended with pursed, tremulous lips without any sound being made; all muscular action slow and difficult. He has a left partial hemiparesis, some spasticities and some coarse tremors.

Case 12, Mr. R., age 28, apathetic, weak, walks slowly with somewhat shuffling gait, words come slowly and monotonously, mask-like face, marked tremor of tongue and face, some stiffness of neck muscles, will lie on his bed most of the day if allowed to do so, is reasonably cheerful, waits on himself and helps with the work about the ward.

Case 13, Mr. R., age 32, always tired and exhausted, stands with head forward, fixed flexed elbows and hands, with hands against the thighs, dragging, difficult gait with short steps, great difficulty in turning, all movements stiff and awkward, some general spasticity, some difficulty in swallowing, tremor of the tongue, eyelids, hands and fingers, expressionless face, dull mentality.

Case 14, Mr. T., age 30, is an ambulatory case. He says that at times he is unable to open his mouth and cannot use his tongue well, unable at times to talk but knows what he wants to say, and is very nervous. He has a coarse, general tremor worse in the right arm and a static face when in repose.

Case 15, Mr. M., age 41, marked dullness and apathy, a decided slowness of physical and mental processes, speech labored and muffled, difficulty in swallowing, a slow spastic shuffling gait, general tremors, slight ptosis, diplopia for near objects, at times the mouth slightly open, corners retracted showing the teeth, usually an expressionless face. At one time I saw this patient holding a cup of coffee to his mouth with both hands, apparently rigid without any evidence of motion, and the whole appearance could well have been the form of a man carved out of inanimate material. He is volitionally practically a blank.

Case 16, Mr. M., age 22, has the staring, flat face, the attitude and gait of paralysis agitans, general hypertonicity, slow, hesitating speech. He will sit up all day unless told to go to bed, or will spend most of the day on the bed. He exhibits catatonic phenomena—cannot carry out suggestions such as putting on his coat or fastening his shoes. He will start the act and stop in the effort until urged to proceed.

Case 17, Mr. G., age 28, is another paralysis agitans type. He is listless, depressed, hypochondriacal, lies in bed many hours a day, eats slowly, difficulty in feeding himself, coarse tremors, speech usually retarded but sometimes free and clear. He says that the top of his head is pushing up.

Case 18, Mr. T., age 30, was in the Indiana National Guard from 1914, and in the World War one year, advancing to the grade of second lieutenant. He was mustered out in November, 1919. He later began work but was much depressed, felt worried, had pains in the back and legs and could not sleep. He worked until September, 1920, but irregularly on account of his physical condition, and none since. Before becoming helpless he could not stand erect or hold his head up in normal position. For the past twenty months he has been in bed helpless, lying on his back, with legs partly flexed, feet in partial extension, arms at his sides, hands across the chest, with flexed wrists and fingers. He cannot move, but if any movement is attempted it is attended by a marked tremor. He cannot talk, has great difficulty in swallowing and when taking his liquid food makes a continuous, pronounced moaning sound with a fear accent. His appearance suggests a general loss of flesh, but aside from this there are atrophic changes in one leg, with partial ankylosis. His face is without expression and he shows no interest in his environment. This is another case of the statue effect.

Case 19, Mr. C., age 27, presents the paralysis agitans attitude but without tremor—motion is very slow but smooth. In feeding himself the spoon travels from dish to mouth very slowly, the mouth is closed with extreme deliberation, mastication and swallowing being performed in the same manner. The face is blank, with the mouth slightly open. He answers questions promptly and intelligently but with very slow, measured speech.

These sanatorium cases are a most interesting group. All developed in the service or very shortly after, and this time element makes them more reliable as a basis for prognosis. This, however, is not promising. None of them as yet are showing any marked improvement, but at this time their residence at the sanatorium is of too short duration to know fully what may be expected from the well directed care and management they are receiving.

I have referred briefly in this presentation to 390 cases reported in medical journals, 10 cases occurring in the practice of Grant county physicians, and 9 cases in the Marion National Sanatorium—409 cases in all. A great diversity of clinical manifestation occurs, as might be expected when we keep in mind the area most involved in the pathology. There is the possibility of one case presenting practically the whole range of symptoms. There may be in any given case manifest involvement of only the oculo-motor area, with diplopia and moderate ptosis, or the manifestations may indicate an extension through the pons, giving rise to facial symptoms, or still farther downward into the medulla, giving rise to disturbances of mastication, swallowing, and disturbances of heart and respiratory rate, or the meninges or cortex may be so involved as to give rise to the predominant symptoms.

The one outstanding feature of practically all cases is a slowing down of both physical and mental activity. Muscles that are not paralyzed will respond to volitional impulses—but often with marked slowness and hesitation. The mentality is usually clear but hesitating and slow. Practically 50 percent of all cases present the paralysis agitans type of syndrome. The other 50 percent as a group will show physical and mental hebetude, with retarded response, lack of endurance, loss of initiative, interest and

power of concentration, localized or more general twitchings, choreiform movement, spasticities, localized or more general, pareses, partial or more marked, local or more general.

This latter group is in a way the more pitiable because of their likely greater mental alertness. They come to a realization of their serious condition and suffer from the consciousness of it. The first group no doubt suffer from a like consciousness of their condition. They are so often the picture of abject despondency.

In many of these cases there is a social and physical history which suggests a fundamental status out of which might develop some of the phenomena seen in convalescence and later. The dementia præcox symptoms, the extreme types of neurasthenia and psyscasthenia may more easily appear from excitation of a previous predisposition. This type of predisposition has been found in cases of shell shock and other calamitous experiences of soldiers on the firing line.

The various manifestations that occur in the acute stage, the stage of convalescence, or as true after-effects, are the logical outcome of a severe inflammation of nerve tissue. The damage is essentially interstitial. The nerve cells are not usually, in the earlier stages, directly affected. Repair fibrosis in nerve tissue is often progressive and this may contribute to the disastrous results. The after-effects in this disease are not always due to a loss of function of ganglionic centers but to an interference with the transmission of impulses.

Ultimate recovery in a large percentage of cases is questionable. It is yet too early to arrive at entirely satisfactory conclusions. We have ahead of us a period of study and collaboration. The convalescence is so protracted and the end results as far as observed are so persistent and intractable that our data will not carry the value we would like until another year or two.

THE THERAPY OF SYPHILIS*

J. E. LUZADDER, M. D.
BLOOMINGTON

"Know syphilis in all its manifestations and relations, and all other things clinical will be added unto you," says Sir William Osler. In other words this disease has been said to be responsible for one-third of pathology, is the chief factor in organic disease of the nervous system, and one of the principal causes of insanity, being responsible for 12 percent of the 200,000 cases of insanity in the United States. Syphilis is often a factor in the etiology of epilepsy, diabetes, Bright's disease and cirrhosis of the liver, as well as a predisposing cause of cancer and tuberculosis. We are told that 10 percent of our male population has syphilis, congenital or acquired, and that 10 percent of the dermatoses are specific.

The discovery of the spirochete, the Wassermann test and salvarsan may be aptly called "the German syphilitic trinity". These discoveries have advanced our knowledge considerably; but, on the other hand, they have made clinical diagnosis, the highest attainment in medicine, take a back seat, with rather disastrous results, and we must view with concern the decadence in our ability to make clinical diagnosis, and the tendency to depend entirely upon the laboratory.

It would appear, for practical purposes, that there probably is no appreciable time during which a syphilitic infection can be regarded as confined to the focus of entry, but that immediately infection takes place the spirochetes begin to multiply and invade the surrounding tissues, gaining access to both the lymphatics and the blood stream, and are widely distributed over the body even before the initial lesion can be detected.

To combat this spirochete and thus prevent syphilis, we may consider the chemical and the constitutional methods. As to the former, the efficacy of calomel or other spirocheticides, in the so-called chemical prophylaxis of syphilis, is limited to a period of not more than eight hours after the spirochete has had the opportunity of invading the healthy person. Regarding the constitutional method, the German and French literature contain reports of the successful use of arsphenamine in the prophylaxis of syphilis. This procedure has been instituted in this country. The doses selected are small and administered prior to the appearance of the initial lesion in persons who are *definitely* known to have been exposed to syphilitic infection. The results of this prophylactic treatment are encouraging.

To assist us in the diagnosis of syphilis comes the Wassermann reaction, and of the many epoch-making discoveries in medicine, few outrank the Wassermann test in their significance and in their usefulness, especially when lesions of the viscera develop. This test is of great value in the diagnosis of obscure constitutional maladies. We would say, in matters of particular diagnosis, that the Wassermann test is a good servant but a bad master; a valuable aid, since it proves that the patient is suffering from syphilitic infection in some form or other, but a danger if taken to indicate that any and every lesion which can be seen on the patient is syphilitic. With all respect to the dark field illuminator in the primary lesions, and later the Wassermann test of blood and spinal fluid, too much emphasis cannot be laid on the fact that in many cases of syphilis, as in any disease, a diagnosis can be made, and must be made, by clinical signs and symptoms.

(*) Presented before the Section on Medicine of the Indiana State Medical Association at the Muncie session, September, 1922.

In the year 1910 salvarsan came on the market—a yellow powder, 31 percent of which is arsenic. Within a few years dozens of deaths were reported as being caused by salvarsan. A preparation of arsenic containing 20 percent, called neosalvarsan or neoarsphenamine, was marketed. One fact about the arsenical preparations must be borne in mind, namely, that they will render infectious lesions organism free in the course of a few hours; from a public health standpoint this is of the utmost importance. The injection of cloudy or turbid solutions of neoarsphenamine will almost invariably give rise to severe nitritoid symptoms in which syncope and shock-like collapse are the outstanding features. Neoarsphenamine should never be given unless the solution be perfectly clear. The more concentrated the solution the greater the danger. The effect of 0.45 grams of neoarsphenamine is magical when applied locally to a chancre, or intravenously. One dose 0.45 grams neoarsphenamine will in 24 hours cause the destruction of all accessible spirochetes in the body. Mercury may be given 10 days to equal an arsenical in this respect.

The histological findings in cases of death from neoarsphenamine shows the toxic effect to be chiefly exercised on the endothelium of capillaries. Chronic headache, loss of weight, which are occasionally displayed in the fifth and sixth doses of neoarsphenamine, are signs of intolerance and one should be on his guard. Exfoliative dermatitis is rare. Broncho-pneumonia may complicate and is particularly fatal. Jaundice is less frequent than dermatitis, and is very persistent. Severe cerebral symptoms characterized by intense headaches followed by mental confusion, epileptiform convulsions, coma, and in some cases death, have been recorded by a number of writers. They have become much less frequent recently, probably due to greater caution exercised as to initial dosage and care regarding the purity of solutions. Should a patient experience a bad result, he should be bled, take saline purgatives and bland liquids. Icthyol gr. V twice a day in capsules is indicated in pronounced dermatitis; also icthyol ointment 10 percent. Calamine lotion is a relief.

Hemorrhagic encephalitis may occur after injections of neoarsphenamine in any stage of syphilis, and in otherwise healthy subjects. It does not appear to depend on the dose. This condition is a grave one, and is usually fatal unless treatment is promptly administered as soon as the condition is recognized. This treatment consists in:

(1) Intramuscular injection of 1 to 1½ cc. of adrenalin 1 to 1000.

(2) Phlebotomy to 20 ounces.

(3) Lumbar puncture, with removal of 20 cc. cerebro-spinal fluid.

In syphilitic meningitis the headache may require aspirin or it may be so severe as to require opiates; although it usually will yield to some form of specific medication.

A hemiplegia occurring suddenly, with symptoms of apoplexy, should be treated with absolute rest, ice packs to the head and liquid diet. Massage, hydrotherapy and electricity may be used to advantage in treating the permanent paralysis.

Gummata of the brain may require treatment other than specific, according to the location, number and size, and the symptoms produced. Numerous investigators have practiced surgical procedures on brain gummata with more or less success. If a certain diagnosis of brain gumma has been made and it does not yield to specific treatment, and further, if the tumor is in an accessible position, surgery should be tried.

Many substitutes have been brought forward to supplant mercury, only to pass into oblivion, until now even in spite of the recent tremendous assault by arsphenamine, it still reigns supreme. The use of mercury in the treatment of syphilis enjoys an undisturbed position. In order to avoid gastro-intestinal derangements mercury should be given intramuscularly, for if given intravenously toxic conditions may arise. The beneficial effects of mercury internally are due to the actual destruction of the infecting organism by the mercury itself, as well as to the stimulation of the formation of anti-bodies. One grain of mercury is often sufficient to carry the patient seven days. The role of mercury in the combined treatment would appear to be rather that of an agent which can safely be retained in the tissues, and by which the effects of the arsenical preparations are maintained for long after the latter has been excreted. Neither can it be said syphilis can be cured by the arsenical preparations alone, but the negative reaction may result from the combined drugs.

When the kidneys are diseased it is necessary to watch the urine carefully to see that mercury, which has a great affinity for the cells of the kidneys, is not adding to the toxic effect of any arsenical preparation which may be used in combination, and, altogether, the regular examination of the urine is a necessary part of the syphilitic treatment. Wolffenstein, working under the A. M. A., in 1913 reviewed all the fatal therapeutic mercurial cases since 1883, and reported 108 in number. A certain risk accompanies the administration of mercury and arsphenamine simultaneously, so that for a continuous effect to be obtained, periods of mercurial treatments alone should alternate with periods of treatments with arsphenamine alone.

May we do honor to iodine? It is fairly certain iodine does not act on the spirochete, since in primary and secondary syphilis it does not

cause these parasites to disappear from the various lesions, nor does it influence the Wassermann. Iodine neutralizes the action of the agents, which prevents resolution and absorption of the diseased or necrotic tissue, and at the same time lays bare to the action of the real germicidal agent the infecting organism, which previously had been protected by necrotic tissue. With the exposure of the infecting organism, such agents as mercury and the arsenicals would be much more effective. Iodine absorbs newly formed connective tissue, upon which depends its virtue. Syphilitic tissue is connective tissue. In the early stages of syphilis such tissue encapsulates the spirochetes and therefore the latter are inaccessible to arsenic and mercury in the blood stream.

For ordinary syphilis the hot springs are comparatively valueless.

In early cases the spirochetes are many, widely disseminated and cause little or no tissue destruction. Organisms accessible to the specific drugs are destroyed and in favorable cases cures effected. In a large percentage of cases, however, the treatment is not carried out in an intensive fashion, and as a result the organisms persist in the viscera, cardio-vascular or nervous system, and slowly cause tissue reactions and degenerations.

It is a mistake to imagine that the treatment of syphilis consists only in the administration of a certain amount of salvarsan, mercury, intrimine and the iodides. To treat the disease successfully much more than this is required. In each case the individual morbid tendencies, both inherited and acquired, must receive careful attention. For instance if the patient is gouty, rheumatic or tubercular, these conditions, which probably will modify the course of the disease, must be treated, as well as the disease itself. In other words, it is necessary to treat the patient as well as the disease. Treatment should be individual and not routine.

In the therapy of this disease the drug intrimine is referred to above. Intrimine is a sulphur product, a reducing agent which prevents arsenic and mercury from exercising a toxic influence on nerve tissue. This drug is given intramuscularly in doses of 2 to 5 cc. If the syphilitic case is gotten before the stage of generalization, every effort should be made to rapidly sterilize the patient. If, as McDonagh has shown, neosalvarsan is combined with one or two doses of intrimine, the maximum amount of the arsenical will be taken up, and the maximum amount of protection for the nervous system will be secured.

During the stage of generalization, the ideal method of treatment may be otherwise, as here we should administer the arsenical in such a manner that its absorption may be slow, steady and gradual. The medicament will then be able to find its way to the intrathecal system, and it will not produce a sudden, general, complete systemic sterilization with consequent destruction of anti-body supply. Anti-body supply should be conserved over a long period of time. In stressing the importance of neoarsphenamine and mercury in the chemo-therapeutic attack on the treponema pallidum and the pathological formations caused by it, too frequently the physical condition of the patient and the toxic effects of the drugs upon him are forgotten. Proper hygienic treatment of the patient is necessary to stimulate his resistance and to assist the action of the drugs. The preliminary examination of the patient should include a study of all his organs and their functions, so that proper hygiene can be advised and tonics administered when needed.

In early cases the arsenical remedy, properly used, gives good hope of arresting the disease. In later stages the outlook is not so certain, but the treatment is almost always worth a trial.

In general the lesions of the central nervous system due to inflammation or exudation are much improved or eliminated by general treatment of patient. All methods of treatment fail in certain types of neurosyphilis because of the inability to reach the organisms in inaccessible localities, and because of secondary degenerations of tissue which cannot be restored. The treatment of neuro-recurrences which is almost unanimously advocated, is the prompt administration of arsphenamine or neoarsphenamine and mercury, and the happiest and most permanent results are obtained when the arsenical preparation is pushed to an extent far beyond what is usual in ordinary routine work. It is imperative to realize that neoarsphenamine, if given in sufficient amount, and over a proper period, can be the means of totally destroying the active agents, and of thus producing a cessation of the disease. On the other hand, an insufficient quantity may be the means of undermining the body resistance, so that the spirochetes present in the cerebro-spinal fluid may act as a greater irritant to the parts and tend to produce rather than retard neuro-recurrence.

Subsequent treatment depends upon the behavior of the Wassermann reaction, and no case should be considered as exempt from the necessity of further treatment until after it has been shown possible to obtain negative blood and spinal fluid reaction, and total absence of symptoms during consecutive periods of three, six and twelve months following the last treatment.

Although only about 20 percent of syphilitics develop neurosyphilis, when this percentage is computed on the syphilized population of a country it makes the question not only individual but one of the greatest importance to the state. The nature of the disease itself, with its insidious development, its onset during the prime of life, the loss of power to earn a livelihood, and the eventuality of the patient becoming a charge

of the state until a miserable death from paresis or tabes ensues, makes an early diagnosis, and early and efficient treatment, of the utmost importance.

In tabes dorsalis the clinical results following the use of the arsenicals intravenously have not been eminently satisfactory, and workers have been giving attention to the intraspinal treatment of this disease.

Actuated by the fact that the spinal fluid, as the result of the intravenous treatment with the arsenicals, contains little or no arsenic, Swift and Ellis instituted the intraspinous injections of arsphenamized serum, which aroused great attention, and since the publications of their investigations numerous workers have applied their method and it has stimulated others into devising similar procedures, so that today intraspinal and intracranial treatments have taken a permanent place in the treatment of syphilis of the nervous system. Paresis seems most resistant to this type of treatment which, from the location of the organisms, is to be expected, although some very encouraging results have been obtained in early cases of this disease.

The treatment of paresis, like the treatment of smallpox, should be preventive. In order that this may be accomplished the potential paretic must be recognized by his spinal fluid findings. Long before clinical evidence is at hand, the colloid gold test will give warning. If this is heeded, and appropriate treatment instituted, paresis may be prevented.

The results obtained in tabes by the combined arsenical and mercurial treatment are greatly superior to those accomplished by the administration of the arsenicals alone. Direct medication of the spinal fluid may well be restricted to the hands of experts, as a most unfortunate accident occurred in the Los Angeles County Hospital in March, 1914, when eight deaths followed the intraspinal injection of neoarsphenaminized serum. In contrast, however, to the almost brilliant results obtained by most investigators, Sachs, of Mt. Sinai Hospital, in 1916, states that the intraspinous therapy possesses no advantage over the intravenous and that the former method is of occasional and secondary value only. Since the institution of modern methods of treatment, the prognosis of tabes has become more hopeful, and even in cases of long standing may yield in a remarkable manner. It must be said, however, that those cases which are early recognized and show the greatest activity of the syphilitic process, that is, those with positive laboratory findings, are the most amenable to treatment. Cases in which marked degenerations have taken place cannot, of course, be restored to normal; but the process can be stopped and at least the subjective symptoms, the lightning pains and crises may be relieved. This in itself constitutes a distinct victory, as probably no suffering in all the field of human ills is more intense. When tabes has reached its final stage the treatment is no longer indicated, because it may aggravate the clinical picture.

All types of syphilis of the nervous system found in the acquired form may be seen in congenital syphilis, including syphilis of the nerves, arteritis, meningitis, cerebral and spinal gummata, as well as paresis and tabes, the treatment of which as outlined for the acquired form is largely indicated. The prognosis of involvement of the nervous system in congenital lues is more unfavorable than such involvement in the acquired form of the disease, and most cases lead to a fatal termination.

This disease is a common cause of nutritional disorders, arrested development, and malformations in the progeny. The best way to treat congenital syphilis is to treat the mother before the child is born.

In starting treatment in infants with florid syphilis, it has been found unwise to begin with full doses of the arsenicals. Theoretically, the ill effects are due to the sudden killing of large numbers of spirochetes, with resulting damage to the patient. Soluble mercury intramuscularly may be used the first few weeks, to be followed by the arsenicals in very small doses. A little later, larger doses may be given.

If syphilis is well treated in infancy, the number of syphilitic defectives will be so small as to be almost negligible. The family of every syphilitic patient should be examined, irrespective of the stage of the disease or the symptomatology presented by the patient when first seen. If this is done, cases of conjugal and congenital syphilis will be discovered which would otherwise be neglected. They will often be found at a period when symptoms are not active, and thus treatment may be instituted before irreparable destructive lesions have occurred. An opportunity is offered to prevent the development of such disabling conditions as general paresis, tabes dorsalis, aneurisms, and the like. The possibility of bearing healthy children may be thus increased. Syphilis in women is the worst of the evils caused by syphilis. Many mothers show no evidence of the disease until after the child-bearing period is over, and as often as not the Wassermann reaction during this period is negative.

Many physicians and dentists present extragenital chancres, and it must be borne in mind that the blood of all syphilitics is infectious, the congenital least so, the blood in primary and secondary stages being more capable of conveying the infection than that in the tertiary or latent stages.

In conclusion may we say that in the treatment of syphilis no single sign of improvement should be accepted as definite or final, and treatment should not be stopped at such indication.

Only cessation of all symptoms with the incidence of repeated negative blood and spinal fluid means a cure. However, a normal spinal fluid does not necessarily indicate a cure. In fact, neurosyphilis can exist in absence of spinal fluid finding even when untreated; but the spinal fluid should be interpreted with the symptoms and physical findings. Neoarsphenamine therapy is necessary since it controls infectivity and contagion. It yields quick results. Mercury is essential, but as a splint to our arsenic therapy, and as an aid to a permanent cure. Over-treatment is preferred to lack of treatment. One needs to review but a small proportion of the mass of present day literature on the treatment of syphilis to be convinced that mercury, not by the month, but by the year, and the arsenicals not by the dose, but by the half dozen of doses, must be given before any hope of a cure of syphilis can be held.

The advance made in the knowledge of syphilis during the last seventeen years finds no equal in the entire history of medicine.

Syphilis is no longer to be considered a genito-urinary disease, nor a dermatological disease, nor a disease belonging exclusively to any specialty; but it is to be thought of as a disease requiring knowledge in all fields of medicine. It is, however, the general practitioner or the genito-urinary specialist upon whom the burden of responsibility should rest, for one of these as a rule sees syphilis in the beginning, and if his work is well done, there should be no need for that of others in the majority of cases.

DISCUSSION

DR. CHARLES P. EMERSON (Indianapolis): The treatment of lues is such a huge subject that any discussion must apply to definitely limited points. Dr. Luzadder certainly sounds a timely warning in urging long-continued treatment and caution in prognosis.

May I relate an incident that occurred in 1908 or '09? I happened to be a guest in one of the hospitals where the first doses of salvarsan were administered. Quite a large group of doctors were present, all clothed in surgical gowns. The professor of medicine, who prepared the solution, and the professor of neurology, who assisted him, were clothed in white gowns, with surgical masks and gloves. They also had the permission of the patient's parents to give the injection. Everything ready, we marched down the corridor two by two to the patient's room. The professor held the syringe at arm's length in front of him and, looking at it, admiringly said: "Wonderful drug! One dose cures a case of syphilis." "Yes," said the neurologist, "wonderful drug! One dose kills every spirochete in the body." Three months later these same men had decided that it was wise to give a second dose; six months later all were giving three or four doses. After about two years, in addition to salvarsan, it was again our custom to give mercury and potassium iodid, not only in larger doses than previously, but for a third year. And recently Dr. Warthin said that he had never yet performed an autopsy on a syphilitic patient, no matter how well treated, but that he had found some active luetic process. All of this only shows that the treatment of syphilis is difficult and everlasting.

Although the work was not on human beings nor on spirochete infection, yet the work of Keyes and others has helped us to understand this problem. They showed that if an infection continues long enough the phagocytic cells designed to protect the body against this germ will not only kill these germs, but will harbor them and protect them against the other protective mechanisms of the body. If we get the case early enough, one dose of salvarsan may cure the patient; and long-standing cases can be checked, but can they ever be cured?

I do think that we sometimes treat too intensively; we should keep our patients in good condition. The problem is not so much intensive as it is everlasting treatment.

One point in connection with gumma of the brain is worth considering. If we are sure that one is present, we feel that the surgeon should do a decompressing operation, not to remove the gumma, but to relieve the pressure which alone, if allowed to continue long enough, will certainly do much damage. Then when our medication shall have removed the tumor we will not have a well but blind, etc., patient.

DR. WILLIAM S. EHRICH (Evansville): I would like to paraphrase the saying of one of my predecessors—that fractures are treated with splints and brains. I should like to say that syphilis is treated with drugs and brains. I know of no routine treatment that will cure syphilis. Each case must be treated as a law unto itself, in the same way as you treat other diseases, or you will not get results. For that reason I think syphilis is one of the poorest handled diseases, because men say they are going to give so many doses of mercury and so many of salvarsan; let the patient take a rest, and then make a Wassermann test. Some patients can stand much more mercury and arsenic than others, some need one drug and not the other, and each one should be treated as a case unto itself.

Of the laboratory aids, the most important is the discovery of the spirocheta pallida by dark field examination by India ink or any other method.

In no disease is the early diagnosis so important as in syphilis, for in the early stages, before the infection has reached the lymph supplied tissue, I think salvarsan will cure, and that it will cure no other type of case. I think the salvarsan does not reach the organisms after

they get into the lymph supplied tissues, but if the diagnosis can be made in the very early stages, it is curative.

I disagree with the doctor in that I invariably use mercury with salvarsan and have never had any unfortunate results. Since the beginning of treatment with arsenic I have always given it in conjunction with mercury because I knew mercury would cure syphilis. I did not know that arsenic would cure syphilis. Mercury makes the tissue an unfavorable culture medium for the growth of the spirochete. Salvarsan kills off all that it comes in contact with, consequently, if we kill those and have an unfavorable culture medium for the rest, it stands to reason that we have a better effect if we combine these two drugs. I have seen patients who have had twenty to thirty injections of salvarsan with a still positive reaction and after a few months a specific dermatosis.

PRESENT STATUS OF THE USE OF DRUGS IN HEART DISEASE

Paul D. White, Boston (*Journal A. M. A.*, Sept. 2, 1922), deals primarily with digitalis and quinidin. The use of digitalis, he asserts, is indicated in only two conditions: first, in heart failure of the congestive type, and second, in auricular fibrillation or auricular flutter with a rapid ventricular rate, whether or not failure is present. Digitalis is a toxic drug, and unless there is some clear indication for its use it should not be given. It is conceivable that it may sometimes do more harm than good. Its routine use in infectious disease, whether typhoid fever, influenza or pneumonia, and its routine use before or after operation are to be deplored. If auricular fibrillation or flutter or congestive failure should supervene in any of these conditions, it is possible, by large doses of digitalis administered by mouth or intravenously, quickly to combat the condition within a few hours at the most. Relatively rarely does such a need arise; therefore, there is no reason for afflicting everybody with a poisonous drug when only now and then it may be needed. Even in emergency, digitalis is often given when it is not indicated. The particularly remarkable reputation of digitalis is due mainly to its dramatic effect in auricular fibrillation. Digitalis acts not only as a stimulant in increasing the degree of systolic contraction in auricular fibrillation as well as in normal rhythm, but also by its sedative action on the heart, it improves the circulation far more effectively in auricular fibrillation than in normal rhythm. In auricular fibrillation, the conduction system is particularly susceptible to the effect of digitalis, and it is in this condition that a rapid reduction of ventricular rate of 20, 40, 60 or even 80 or 100 beats a minute may bring such relief to the heart. The saving of 100 beats a minute for the heart (most of them ineffective anyway in supporting the circulation) means the saving of more than 100,000 contractions a day. This means an astonishing rest for the myocardium in the course of hours and days. Given a leaf of proper potency as determined physiologically, it matters little or not at all whether it is administered in pill form as powdered leaf, by tincture or infusion, though the last, if made according to the U. S. Pharmacopeia directions, will be too weak. Usually not enough digitalis is taken. If there is urgent need for its use, it should be given in sufficient dosage to saturate the system in forty-eight hours or less. Eggleston has suggested 0.15 gm. of the leaf or (1½ cat units) for every 10 pounds in weight. One-half of this amount may be given at once and another quarter after six hours, an eight more in six hours, and so on until saturation is evidenced by toxic symptoms, by marked reduction in ventricular rate or by the production of a coupled pulse. White has found that the amount figured out for a satisfactory saturation may be sometimes 0.1 grain of the standardized leaf rather than 0.15 gm., which in some cases may result in disagreeable toxic symptoms. Also this dosage may be spread through two days more evenly, that is, by giving one-sixth of the dose three times a day for two days. Quinidin sulphate is indicated particularly in the treatment of auricular fibrillation of recent origin, preferably of less than six months' duration, when heart failure has not been, or is not, an important feature, and in the prevention of paroxysmal auricular fibrillation. Chronic heart disease, especially with chronic mitral stenosis and auricular fibrillation more than a year old, is, in general, a contraindication. Heart failure also seems to be a contraindication to the use of quinidin. In twenty-seven cases of auricular fibrillation of less than six months' duration, twenty-two hearts, or 81 percent, were restored to normal rhythm, and fifteen, or 56 percent, maintained normal rhythm. In twenty-three cases of auricular fibrillation of more than two years' duration, eleven hearts, or 48 percent., were restored to normal, but only three, or 13 percent, maintained normal rhythm. In forty-eight cases of congestive failure, thirty-two hearts, or 67 percent, were restored to normal, but only eleven, or 23 percent, maintained normal rhythm, while in twenty-seven cases in which failure did not occur, nineteen hearts, or 70 percent, regained normal rhythm, and fifteen, or 56 percent, retained it. Seven of a group of nine patients with paroxysmal auricular fibrillation (and flutter) have been much benefited because of the marked reduction or abolition of the attacks by quinidin. In other cardiac disturbances, such as premature beats, heart block and paroxysmal

MISPLACED MEDICAL CHARITY

As an evidence of how medical men are imposed upon through the operation of various uplift schemes, mostly sponsored by ambitious women who have neither home nor family ties, we cite the following instances:

A Young Women's Christian Association organized a gymnasium class "for business women", and the originators seemed quite perturbed because a regular physician refused to give gratuitous services in making complete physical examinations for those who desired to enter the gymnasium classes. It should be understood that these business women are all in comfortable circumstances and earn good salaries. Presumably they pay a tuition fee for the gymnasium classes, and there is no earthly reason why a sufficient sum should not be added to the tuition in order to provide a respectable fee for thorough physical examination at the hands of a reputable physician.

In another instance a woman uplifter whose husband regularly employs a man for skilled work actually made arrangements with a surgeon to do a gratuitous operation upon members of the employee's family on the ground that the employee was poor and unable to pay a fee. Without presuming to criticize the female uplifter because her husband failed to pay his employee a suitable wage, yet the fact remains that the employee resented the implied charge that he was deserving of charity and insisted upon paying a modest fee for surgical services rendered.

These are but examples of almost daily occurrences in the lives of busy physicians, and indicate the extent to which charity of one kind or another is unnecessarily bestowed, with the result of pauperizing that large element in society that is perfectly willing to be pauperized or be relieved of any responsibility. Many women who live in hotels or boarding houses and have no responsibilities other than the care of a poodle dog and an occasional soft word for a hard working husband because of the pecuniary recompense that it may bring forth, seem to think that it is a duty they owe to society, even though self-advertisement is the motive, to engage in uplift work of one kind or another. These women are not satisfied to take up with the established social agencies, largely because they can't be "the big toad in the puddle", so they start uplift schemes of their own, with the avowed intention of getting such glory as they can out of the enterprise. It does not make any difference whether there is a crying need for these uplift efforts or not, as long as the activities furnish a medium for self-advertisement and can be labeled "a very worthy object".

The public-spirited citizen is bled for all these uplift schemes, but in view of the fact that so many of these same schemes require the active services of members of the medical profession, whether by way of making physical examinations of one kind or another or in furnishing gratuitous medical or surgical attention, it is apparent that in the final analysis it means a rank imposition upon charitably disposed doctors, and, worse than all that, it means the pauperizing of the community through the bestowal of misplaced and unneeded charity. We confess that it is a little difficult for the doctor to turn down his patient, Mrs. Fatty Limousine, the wife of the banker, when she asks that a gratuitous operation be performed upon the member of the family of a plumber or a coal miner who is pulling down more actual money in a month than the doctor makes in six months, but some means should be adopted whereby this growing imposition can be stopped. It is an imposition not alone upon medical men and others who contribute of services or means, but it is an imposition upon the public because we are creating a dependent class of individuals who shirk responsibility and who grow in the belief that the world owes them a living without turning a hand toward their own economic improvement.

The plan adopted by some medical societies of making it necessary to refer every call for gratuitous medical services for an unbiased and unprejudiced investigation is perhaps one of the best ways to solve the problem. Another way is to insist upon having the recognized charitable organizations of the community give a report upon the propriety of giving gratuitous services. Finally, medical men or medical societies should say to the uplifters, "The services will be rendered for a fee consistent with the ability of the patient to pay, no matter how little the fee may be", and to show that the medical profession is not sordid in making this proposition the offer should be made to turn the fees over to the uplift society if the cases referred really belong within the scope of uplift work.

THE NURSING PROBLEM

The nurses again are agitating the subject of increased compensation and a lessening of hours and duties. Practically all of them now charge and receive from thirty-five to fifty dollars per week together with their keeping, and most of them not only are trying to limit the time on duty to eight hours but insist that relay nurses be employed when cases require constant attention. Aside from this many of the nurses refuse to take anything but the easiest cases or those which may be called "snaps", such as clean surgical cases requiring little or no dressings. Then a certain percentage of the nurses refuse to take cases in private residences and insist upon having nothing but hospital cases. Furthermore, even the nurses in training are getting to the point where they give nothing but the most superficial care to cases, so that in reality a patient in a hospital, even though he ought to get along exceedingly well with nothing but the care of the floor nurses, is compelled to have a special nurse if anything more than the most ordinary attention is required. An analysis of the situation shows that no one but a person with means can afford to have a nurse, and in many hospitals all patients suffer as a result of the superficial attention given.

We have no fault to find with the highly trained nurse who demands and receives high wages for her services from those able to pay, and who is able to limit the hours of work, but we do say that there is a crying need for thousands of real nurses who will take care of the average sick, and especially the people in poor or even moderate circumstances who need ordinary nursing care and of necessity can pay only modest compensation for the same. We confess to having been in sympathy with the various efforts to raise the standard of nursing, but we find that in raising the standard of nursing we also have made it possible for the creation of an arrogant, overbearing and wholly unsympathetic class of women who for the most part are looking not at the humanitarian side of their work but for the greatest remuneration obtainable at the least expense of effort. As a matter of fact people in moderate circumstances no longer can afford to have a nurse. They are able to secure the very best medical and surgical services at fees that are in keeping with the ability of the patient to pay, but when it comes to having a nurse the story is quite different. It is for this class which make up the bulk of those who are sick that we need thousands of good practical nurses, not the highly trained, cold blooded registered nurses with their exaggerated ideas of their attainments, importance and value of their services, but the nurse who can give ordinary nursing care, and who possesses enough of the milk of human kindness to make her sympathetic and helpful in caring for the sick.

DUES AND THEIR USES

A member of the House of Delegates at the Muncie Session suggested that the dues of the Indiana State Medical Association should be reduced, which suggestion very properly met with no favorable action.

In this connection it may be well to consider seriously what the dues are for. Naturally the first thing for which dues are necessary is the running expenses of the Association. This includes the honorarium to the Secretary, the actual expenses of the councilors, the expense of annual sessions, and that part of the cost of publishing THE JOURNAL which is not covered by the advertising income. These expenses are well taken care of by the present dues. However, there are other expenses incurred in carrying on enterprises that are of direct or indirect benefit to the Association and the individual members thereof which deserve the sanction and support of every member.

A few years ago we established a medico-legal defense fund, and at present that fund has in its treasury the limit fixed by the Association as the amount beyond which no further accumulation would be permitted. Both last year and this year the medico-legal defense assessment was turned back into the general treasury. Then we have the expense of various committees, and that includes the expense of the very valuable and efficient work done by the Committee on Public Policy and Legislation. As a matter of fact that committee should have been given ten times the amount expended, provided the work which the committee should do is carried out effectually.

At the Muncie session we provided for an educational committee, with the former Secretary of the State Board of Health, Dr. John N. Hurty, at its head. This educational committee will do a work that should have been done years ago, namely, acquaint the public with the aims and objects of the regular medical profession, the necessity for maintaining high standards for medical education and licensure, and point out the inconsistencies and absurdities of some of the teachings of the pseudo-medical cults, charlatans and quacks which have been growing as a direct result of propaganda that no one has attempted to controvert. It is recognized that we owe something to the public as well as to ourselves, and this being the case we should help to protect the public from the dangers of unscientific medicine and quackery. On the other hand, we owe it to ourselves to protect our position as educated and qualified

physicians, and to prevent, if possible, either legislation or public opinion which in any way discredits the knowledge and experience acquired through long and intelligent effort and great expense.

Every member of the Indiana State Medical Association should contribute his share to these various undertakings, and he ought not offer any objections to annual dues of even ten times what is paid at the present time, as long as he knows that the money is to be expended judiciously and well. Incidentally it may be noted that the very things we are trying to combat are brought about by the active work and the propaganda of the pseudo-medical cults, which cults have spent one hundred dollars to our one in spreading information that is based upon neither facts nor reason. Much of this propaganda has been in direct opposition to the medical profession and to the high ethical, scientific and educational standards that we maintain. As a direct result of this widespread effort on the part of these pseudo-medical cults we stand to lose our prestige and standing, and the public, the one most concerned, to innocently suffer from the effects of ignorance and quackery. Had we turned our hand to the work of defending our position and discrediting the teachings of the pseudo-medical cults we would not now be floundering in the sea of uncertainty as to what the final outcome will be, and it would not be necessary to put forth such Herculean efforts as now will be necessary in order to put the public in possession of the facts. Therefore, our educational committee, with Dr. Hurty at its head, should and will do a work of inestimable value, but to do this will cost money, and the money must come from the regular medical profession. The reserve now on hand in the Indiana State Medical Association treasury should be employed to further the purposes outlined, and every member of the Association should be willing not only to pay the dues that are assessed at present but double or triple the amount if deemed necessary in order to carry on the contemplated work to the fullest extent.

FEES PAID BY INSURANCE COMPANIES FOR MEDICAL EXAMINATIONS

The Postal Life Insurance Company boasts of low expenses in doing business and feels rather proud of the fact that it is able to cut out the expense of agents. It might with equal propriety boast that it gets its medical services at a low rate, but in doing so it would be claiming nothing more than can be claimed by all the other life insurance companies, for not one of them pays a fee for medical services that is at all in keeping with the value of the services rendered. As a matter of fact, the key to the success of a life insurance company, so far as concerns the acceptance of risks and keeping losses at a minimum, depends entirely upon medical examinations. Careful examinations by competent medical men mean the elimination of many risks and losses, and the examiner, if he does conscientious and skillful work, is deserving of adequate compensation. The Postal Life Insurance Company, following the lead of some other insurance companies, has established a "health bureau", and policyholders are asked to take advantage of it by appearing before medical examiners for a physical examination to determine the condition of the health and the possibility of the existence of any abnormal or diseased condition requiring the attention of a physician in order to prolong life and health. The policyholders are requested to report to a physician for what the company says is a "brief physical examination". However, the Postal Life Insurance Company, with the astuteness that is born of long experience in the insurance field, asks the examiner to make a report, which, if filled out intelligently and conscientiously, would require an exhaustive physical examination which if done properly would require at least an hour or more of the examiner's time, to say nothing of the time required to fill in the blank, which covers questions concerning practically every function possessed by the policyholder. For this "brief physical examination" the company tenders the examiner the munificent sum of two dollars. Presumably as a bait to make the examiner think that he isn't doing so much, he is not required to make a urinalysis but is expected to send the sample of urine to the company at the home office in New York. If all the questions concerning the policyholder's physical condition are answered intelligently, as based upon a careful examination, the fee for the services is ridiculously low. On the other hand, if the questions are answered without a careful examination having been made, then the examiner is guilty of dishonesty. In either event someone is bound to get the worst of the deal, and the company is shrewd enough to consider the average doctor honest enough to make a thorough examination no matter what remuneration is received.

The whole thing shows to what extent imposition is practiced upon members of the medical profession by life insurance companies. The principle of trade unionism is absolutely correct insofar as it protects the honest worker and works no injustice to the employer. The principle of trade unionism should be adopted by the medical profession in its dealings with insurance companies of every description, and, in fact, in the rendering of medical and surgical services to any but those deserving of charity. It is the height of folly to argue that doctors must continue to be the only followers of any vocation of whatsoever kind that are not protected in the question of remuneration for services rendered. We are imposed upon by insurance companies because we tolerate it without

a whimper and because we apparently like it. The insurance companies, always on the lookout for saving money except when it comes to the payment of salaries of their officers, take advantage of spineless doctors because it can be done. If the American Medical Association, backed by its 89,000 members, would say to the insurance companies that a ten or twenty dollar fee is a fair and just fee for such an examination as required by old line life insurance companies, and that no member of the Association would make an examination for any less remuneration, the life insurance companies would pay the demanded fee without a word of protest and the cost of life insurance would not be increased a penny. In fact it is a question if a better grade of service could not be secured by the companies through discrimination in the appointment of examiners, and with better examinations there would be an improvement in the risks accepted, a diminution in losses, and a corresponding lessening in the cost of insurance. The question is, how long will the medical profession continue to be unorganized when it comes to looking out for the purely economic welfare of its members?

EDITORIAL NOTES

DEAR DOCTOR:

THE JOURNAL and the Cooperative Medical Advertising Bureau of Chicago maintain a Service Department to answer inquiries from you about pharmaceuticals, surgical instruments and other manufactured products, such as soaps, clothing, automobiles, etc.; which you may need in your home, office, sanitarium or hospital.

We invite and urge you to use this Service.

It is absolutely FREE to you.

The Cooperative Bureau is equipped with catalogues and price lists of manufacturers, and can supply you information by return mail.

Perhaps you want a certain kind of instrument which is not advertised in THE JOURNAL, and do not know where to secure it; or do not know where to obtain some automobile supplies you need. This Service Bureau will give you the information.

Whenever possible, the goods will be advertised in our pages: but if they are not, we urge you to ask THE JOURNAL about them, or write direct to the Cooperative Medical Advertising Bureau, 535 N. Dearborn St., Chicago, Illinois.

We want THE JOURNAL to serve YOU.

PAY your State Association dues and pay them now! Don't wait to be urged by the Secretary and don't procrastinate until you are notified that you are delinquent.

DR. G. W. H. KEMPER, an ex-president and for many years the historian of the Indiana State Medical Association, attended the Muncie session of the Association. He now resides in California and it is very evident that the salubrious climate of his new home agrees with him, as he seems to be young physically and mentally in spite of his advanced age. He was warmly welcomed by his old friends and it is hoped that he will be able to attend many future sessions of the Association.

THE quacks and charlatans usually are found on the front seats of our churches. They put their silver in the contribution box with a loud clatter so as to attract attention, and they pray the loudest at the Wednesday nigh prayer meeting. Strange, but true, these chaps usually have the ear of the pastor, who does not hesitate to recommend them to the gullible portion of his congregation. Is it any wonder that reputable and competent doctors are somewhat nauseated and are not very keen about their affiliation with the church?

THE Indiana State Medical Association should consider itself fortunate in securing the services of Dr. Hurty as chairman of its educational committee and a field worker in the interest of higher ideals and practices in the medical profession. Had he not been financially independent and willing to engage in a work for the love of it and because it represents a principle he desires to uphold, he would not accept the position for compensation that is a half to two-thirds less than he has been offered by numerous industrial concerns that have sought his services.

THE Federal prohibition agents are beginning wholesale prosecutions of doctors who misuse prescriptions for alcoholic beverages. This probably is of little interest to Indiana doctors who are not permitted to write prescriptions for alcoholic beverages, but it indicates the determination on the part of the government to enforce the Volstead Act to the letter. As before stated in the columns of THE JOURNAL, we are not in sympathy with the sentiment which put over the Volstead Act, but we do believe that doctors should be in better business than acting as bootleggers or assistants in procuring liquor by illicit means.

IT is the generally accepted opinion of lay persons that the bite of the tarantula is fatal or at least very serious. Just why this opinion prevails is hard to understand, inasmuch as no trustworthy records concerning the toxicity of the tarantula bite are obtainable. Recently W. J. Burg, of the University of Arkansas, has subjected both animals and men to attack by the fangs of active tarantulas and he reports that the results are put in the category of bee stings in severity and no more menacing or dangerous than the ordinary bee sting. This would seem to prove that the danger from the bite of the tarantula has been very greatly exaggerated.

THE chiropractors believe in advertising, and they are finding some lay periodicals of national circulation that will accept their advertising. Thus *Life*, always violently opposed to rational scientific medicine and a sponsor for all of the "antis" including the anti-vivisectionists and the

anti-vaccinationists, is quite willing to boost chiropractic with all of its fallacies and inconsistencies. However, practically all of the best weekly and monthly lay periodicals refuse to accept medical advertising of any description, well knowing that when such advertising is offered to them it usually comes from quacks and charlatans rather than from reputable medical men. With *Life* it is different.

SOME doctors have gone "nutty" over the subject of vitamines and, profiting by the public interest created by medical agitation of the subject, unscrupulous manufacturers are capitalizing the vitamine demand by putting out commercial vitamines, advertised as possessing unusual therapeutic properties. The advertising matter follows closely the trend of patent medicine advertising in which a large number of diseased conditions are referred to as being cured by vitamines. The public should be informed that concentrated vitamines are unobtainable, and the commercial product should not be substituted for fresh vegetable foods which are in general very rich in vitamines.

THOSE doctors who are interested in spreading the gospel of truth concerning medical fads and fallacies should get in touch with the Propaganda Department of the American Medical Association. Two volumes on "Nostrums and Quackery" published by the A. M. A. comprise a veritable encyclopedia on the subject. In addition to this the Association publishes a large number of pamphlets dealing with various phases of the patent medicine evil and quackery. In brief, the Propaganda Department of the A. M. A. is a clearing house for information on the nostrum evil, quackery and allied subjects. It not only deserves the support of the medical profession but the department should be utilized to the fullest extent in educating the public.

THE sensational trial at South Bend, in which a married woman attempted to prove parentage of her child, brought forth considerable newspaper comment concerning the possibility of determining parentage by blood tests. A San Francisco physician (Abrams) who has been more or less in the limelight and is considered by some as a faker, was offered as about the only one in this country who could determine with certainty the parentage of a child by tests that he is supposed to have either originated or improved upon. In commenting upon this subject the *Journal of the A. M. A.*, October 7, 1922, after discussing the precipitin test, which is used generally to determine the nature of blood stains for medico-legal purposes, and other methods of recognizing variations in human blood, concludes as follows: "The conclusion is that at present science knows of no blood test by which parentage can be determined."

THE *Boston Medical and Surgical Journal* calls for some constructive action from the American Medical Association. Our law makers really desire information relating to benefits and dangers of measures presented as well as political effects of their decisions. They are entitled to respect insofar as they are honest servants of the people, but they should not be left without all pertinent information. The American Medical Association could present the highest type of information in all matters relating to public health and the maintenance of efficient public health service, and to this end should establish a committee composed of representatives from all of the states. This body should be paid a reasonable compensation for time given and should study proposed legislation, decide upon a course of action, and with the dignity and power of the Association behind it, tell Congress what should or should not be done.

As diphtheria seems to be more prevalent during the winter months it may not be amiss to call attention again to the results of active immunization with diphtheria toxin-antitoxin. Three doses of toxin-antitoxin, each from 1 to 1.5 c.c. injected a week apart, should be administered. A longer interval between the injections, probably two weeks, may be found to be of advantage in producing a better immunity. At least six months should be allowed to elapse between the injections of toxin-antitoxin and the Schick retest to determine the development of an active immunization. A second series of two or three injections of toxin-antitoxin should be given to those who have not become immune after the first series. There are a few people who are difficult to immunize with toxin-antitoxin, even when they are given several series of injections. There is practically no danger from anaphylaxis, either in repeating the injections of toxin-antitoxin or in giving toxin-antitoxin as a preliminary to injection of antitoxin.

IN the scheme of organization of the chiropractors is a plan for providing medico-legal defense, and in Fort Wayne a company has been formed for defending chiropractors in malpractice suits. It will be interesting to know just how they will succeed in protecting chiropractors when the courts are called upon to decide upon the fitness of chiropractors to practice upon the sick and suffering. At present they are law breakers, which in itself puts them beyond the pale of protection by law for their acts, and it will be interesting to note whether the courts will sustain them in their radical and inconsistent claims concerning the cause and treatment of many diseases the nature of which has been known and recognized by scientists for many years. As a matter of fact we would like to see a few malpractice suits

for the purpose of showing up the inconsistency and ignorance of these pretenders. It is only when the public really becomes interested in suppressing imposition that chiropractic will be suppressed.

AT a recent meeting of the Kosciusko County Medical Society a resolution was passed recommending that House Bill No. 267, introduced at the last session of the legislature, be reintroduced in the coming session of the legislature and that an amendment be added to the bill to read as follows: "For the purpose of enforcing the provisions of this Act it is hereby made the duty of the Judges of the several Circuit and Superior Courts in this State, and they are hereby expressly granted power so to do, on proper showing made that any person in said State is practicing medicine without a license as defined herein, to grant temporary and permanent injunctions restraining and enjoining such persons from continuing so to practice medicine in this State until such person or persons have complied with the provisions herein provided."

The object of this amendment is to enjoin anyone from practicing medicine until he has complied with all laws pertaining to licensure.

No matter what caused his defeat, let us be thankful that Nathaniel C. Ross, president of the Ross Chiropractic College of Fort Wayne, and aspirant for a second term in the Indiana legislature, failed to secure re-election. In the last session of the Indiana legislature he was the author and principal defender of the chiropractic bill which failed of passage, and it is a well-known fact that the only reason why he desired to become a member of the legislature was for the one purpose of obtaining legislation favorable to the chiropractors. In reality we are a little surprised that he was defeated, for no candidate ever had as many satellites working for him night and day. The chiropractors, the chiropractic students and their intimate friends, probably numbering several hundred, worked long and ardently for their leader, and there is no doubt that such politics usually brings about victory if there is little opposition on the other side, and in reality the regular medical profession scarcely turned a hand to defeat Ross. Anyway, we may feel that the wings of Ross have been clipped, and while he probably will camp at the next Indiana legislature "with bells on", yet he will not have the same influence as he would have had he succeeded in being elected.

ACCORDING to newspaper reports, Professor Lorenz is back in this country again and this time to remain permanently. As a matter of fact he has found America to be a very hospitable place. The lay press has heralded him as the world's greatest orthopedic surgeon, and in order to place himself upon a firm basis with the American people and to secure the most flattering advertisement through the public press, he started what was supposed to be some charity work for the crippled children of America on the plea that he wanted to pay the debt that Austria owed to the American people. While doing this charity work he profited by the advertising and managed to see a sufficient number of private cases to insure him a very handsome income. With his introduction to the public through the lay press and the acquisition of a lucrative practice in consequence, he finally concludes to locate in America. We haven't the slightest objection to Professor Lorenz' decision to come to this country to make his home and practice his profession, but we feel that he is coming under false colors just as he started his charity work under false colors. The medical profession of the country has been criticized severely because it did not welcome Professor Lorenz and sanction his conduct in coming here a few months ago to do surgical work, but events prove that it is wise to withhold approval when motives and actions are open to suspicion.

IN all probability many harmful effects caused by the indiscriminate use of laxatives and purgatives through self medication on the part of the laity escapes the attention of medical men. The *Journal of the A. M. A.* has called attention to phenothalein dermatitis, and the distinct concentration of the blood caused by Epsom, Rochelle, and Glauber's salts, whereas no such effects attend the laxative use of castor oil or cascara sagrada as representatives of vegetable purgatives. It is quite conceivable that undue concentration of the blood from any cause may lead to distressing symptoms and, accordingly, care should be exercised in the administration of purgatives in diseased conditions, especially in those states known to be responsible for concentrated blood. Pharmacologists have pointed out that salines in dilute solutions are more serviceable than salines in concentrated solutions as ordinarily used. The advantages which natural mineral waters have over the solutions of purgative solutions as usually employed is that they are very dilute and the patient is thus required to consume a fairly large amount of water with them. However, this advantage may be secured by proper dilution of purgative solutions, with the attending saving of expense over that required for the use of the natural mineral waters. Aside from this the drinking of a large quantity of water in connection with the salines very largely offsets the tendency to concentration of the blood that otherwise occurs.

IT seems to be perfectly natural for the world to attempt to fasten crime upon a suspect, even though the suspect may be perfectly innocent. Who of us if suspected of crime, even though

perfectly innocent, could stand the grilling repeatedly and for hours at a time by policemen, detectives, and newspaper reporters who analyze every action, facial expression and answer, not with a view to gaining the truth but to obtain some evidence that will enable them to fasten the crime upon a suspect. Few human beings are able to go through such an ordeal and not become confused and under the nervous strain contradict themselves in minor points, all of which is seized upon by the merciless inquisitors as spelling guilt. Perhaps this sort of thing has been the means of unearthing the perpetrators of crime in some instances, but often it places a perfectly innocent person before the bars of justice. To our notion there ought to be some provision in law to protect anyone, guilty or innocent, from the needless and brutal inquisition that all too frequently occurs in connection with criminal cases. For the protection of society, all reasonable and consistent methods of detecting crime should be adopted, but this idea of permitting the hit-and-miss inquisitorial work on the part of pseudo-detectives, newspaper reporters and even policemen, is all wrong and all too frequently becomes a grave injustice to perfectly innocent people. The numerous episodes in connection with efforts to discover the murderer of the New Jersey minister and his choir leader is a case in point.

EVENTUALLY the public will get wise to the inconsistency of permitting the quacks and incompetents to prey upon the sick and suffering without let or hindrance. The chiropractors have been gloating over the fact that in most states they have been unmolested, and in a few states attempts have been made to have the sect recognized legally. In New York State a bill which would recognize the chiropractors as competent to treat the sick and suffering was presented, and when it was before the governor for signature the *New York Tribune*, recognized as expressing sound and conservative views, had the following to say: "The public has not followed the details of the debate over the chiropractic bill now before the Governor for signature. Nor is it necessary to do so. To arrive at a judgment it is enough to know that on one side are the advocates of quackery and on the other those who would suppress quackery. The issue is the simple one of whether fraud is to be encouraged or discouraged. The quack, though he often changes his masquerade, is a member of an ancient profession. Knowing human aversion to pain and human gullibility, he exploits his fellow creatures by selling a cure-all. When men believed in evil spirits he marketed incantations; when medicaments came into use his herbs were sure cures, and in these later days he specialized on psychology, or laying on of hands, or blue glass, or cold water, or bone manipulation. Though his prescriptions are altered to meet new conditions, he always has a panacea to dangle before the credulous."

THAT old warhorse, Dr. John N. Hurty, for more than a quarter of a century the able and aggressive secretary of the Indiana State Board of Health, has been elected a member of the Indiana legislature. The good people of Indiana, including the medical profession in particular, can be thankful that such a clear-headed and forceful character will represent them in shaping legislation that will either make or mar conditions pertaining to public health, sanitation, medical education, and medical licensure, to say nothing of being on the right side of every question that has to do with the welfare of the good people of Indiana. Incidentally it may be remarked that previous to the election, Dr. Hurty, over his own signature, stated that if elected to the legislature he would stand steadfast and true for all medical measures approved by the legislative committee of the Indiana State Medical Association, and stand strong against any measures which the Association is against. In passing, it may be stated that the report gained credence that Dr. Hurty, in deference to some of the women's clubs, had become an avowed advocate of the Shepherd-Towner Act. As a matter of fact he, like practically all members of the Indiana State Medical Association, is opposed to the Shepherd-Towner Act and all other acts of like character. He also is opposed to the act which appropriated large sums of money to the states for the purpose of fighting venereal disease. Both violate the same principle. In reality, Dr. Hurty will stand for those things which will make better citizens, and Indiana a better place in which to live. In doing this he will not be influenced by any maudlin sympathy, or by any desire to profit through preferment.

SOME doctors think that a government position is a "snap". In a sense it is, for most government officers loaf on the job and do not render enough actual service to entitle them to even the pay that they receive. In due course of time a government employee gets so used to putting in short and easy hours, and calling it a day, that he can't work like others who are occupying jobs that require service and perhaps competition. Now comes an act of Congress which makes it necessary for the retirement or discharge of a number of professional men, among which are many medical men. The officers to be retired or discharged have served the government for a long period of years, some of them twenty years or more. This means that a government position is not a "snap" and may be lost at any time, but it also means that those men who have been in the service for many years are very apt to be out of a job for a long time to come, as they are fitted for nothing

but the service in which they have been engaged. They probably will be utter failures in private practice, and we doubt if there are any commercial or industrial enterprises that will be willing to give them employment or could give them employment on the basis upon which they worked for the government. Now and then a man who naturally is energetic and ambitious may succeed either in working up a place for himself or in filling a place that is offered him, but in the main these government employees are going to find it tough sledding to get along, and all because our government, with its recognized tolerance of slothfulness and oftentimes incompetency, has permitted these men through years of service to acquire habits that are not in keeping with the highest efficiency demanded in civil life.

WE hear much about the impropriety of attempts to organize the medical profession to protect its economic standing, but it is about time for medical men to wake up and realize the importance of organization if they desire to save themselves from ruin. It sounds very nice to talk about humanitarian motives being the only guide in the practice of medicine but it should be remembered that doctors require roofs over their heads, clothing to cover their nakedness, and food to fill their empty stomachs, and nothing will bring forth these purely physical wants but the return of "filthy lucre" for services rendered. In Europe the medical profession has been reduced almost to pauperism, and all through lack of organization. If the doctors used half the business sense that is employed by the plumbers, printers, carpenters, brick masons or those following almost any other vocation in life, there would be no such thing as doctors making calls for ten and twenty cents each, as they do in England, and subject to penalty if anything more is charged. Is it any wonder that some of these doctors are taking up trades in order to earn even a comfortable livelihood? As a matter of fact medical men are the most gullible on earth, to say nothing of being the most apathetic concerning things that concern their own welfare. Self-preservation may be the first law of nature but it seemingly is not considered by the medical man, and sooner than he expects the average doctor will find himself virtually out of a job as a direct result of permitting the world to walk over him without protest. The only way to stem the tide of destruction is to organize the medical profession, and stick together in demands for those things which pertain to the economic independence of medical men.

IN the final passage of the tariff bill, the Senate reversed its position on the importation of dyes and synthetic medicines, and placed extremely high duties on all such articles. This action of the Senate is in accord with the position taken in THE JOURNAL in its editorial announcement of August 12, in behalf of American-made synthetic chemicals for medical purposes. There was read to the Senate a letter from Secretary of War John W. Weeks urging that the American dye industry and synthetic medicine industry be protected in the interest of national defense and public health. While the Senate did not vote that there should be an embargo on these products, the tariff duties are of such nature that they will in effect be a conservative check on the importation of dyes and synthetic medicines derived therefrom. The new duties are based on American instead of foreign valuation. They fix the duty on coal-tar dye intermediates at 10.5 cents a pound and an additional 75 percent ad valorem, and on finished dyes and coal-tar products 90 percent, ad valorem. In urging the adoption by the Senate of these rates, Senator Wadsworth of New York showed that England, France and Italy have placed an embargo against the importation of dyestuffs. He said that as a people we have paid little attention and given small encouragement to scientific research. He asserted that chemical laboratories cannot be maintained unless there is a chemical industry, and that research in the laboratory and chemical industry go hand in hand. As a result of the favorable action taken by the Senate on this legislation, it is said that approximately 200 laboratories and plants manufacturing medicinals and coal-tar products which have been built up in this country since the war will be enabled to continue operations which otherwise must have gone out of existence.—*Journal of A. M. A.*, Aug. 26, 1922.

WE are hearing a great deal about the theories and practices of Dr. Albert Abrams, of San Francisco, and some doctors have been so impressed with the so-called marvels of Abrams that they are accepting his theories and using his treatment. Incidentally the Abrams theories and treatment seem to be a fertile subject for professional advertising. Occasionally we run across a patient who is singing the praise of Abrams and quoting from the writings of that gentleman. In commenting upon the matter the *Journal of the A. M. A.* says, "In any event it is all very interesting hot weather reading when one does not want to think."

A few weeks ago the *Boston Medical and Surgical Journal* pointed out the fallacies of Abrams' claims and the absurdities of his cult, and later Abrams, who came on to Boston to prove his theories and was given every opportunity desired or asked in order to establish his reputation as a miracle man, seems to have succeeded in showing himself up as a monumental faker. In fact, the *Boston Medical and Surgical Journal* declared that Abrams' visit to

Boston disclosed two outstanding facts: First, the man persistently refused to submit his methods to tests that could be scientifically controlled or to give a demonstration under conditions that would be subject to the usual rules of scientific criticism; second, in the one case in which he did demonstrate his methods, he found syphilis, tuberculosis, sarcoma and streptococcus infection in a healthy individual. It was pointed out that if Abrams can diagnose disease where no symptoms exist he certainly should have been willing to submit to a test based on the diagnosis of blood specimens from patients with definite ailments. The fact that Abrams refused to perform such tests speaks more eloquently than any critic. Abrams, it is said, claims that his electronic reactions are either the greatest miracle of the age or the greatest fake. Here we have a point of agreement with Abrams—and the electronic reactions are no miracle.

Two or three years ago the House of Delegates of the Indiana State Medical Association passed a resolution, the essence of which was a request that the Indiana University School of Medicine thoroughly investigate the subject of physiotherapy and report its findings to the Association. As we remember it there was a clause in the resolution which asked the medical school to establish a chair of physiotherapy as a part of the medical teaching of the school, if, after thorough investigation, it was deemed of sufficient importance to justify such a move. We have heard nothing further concerning the matter and we believe that the request made was worthy of serious consideration.

Unquestionably there is a field for physiotherapy, and it is because there is a field which we so long have ignored that the osteopaths, the chiropractors, and others engaged in purely mechanotherapy, have been able to accomplish some results and to thrive in consequence. Of course we recognize the fact that these pseudo-medical cults are irrational and inconsistent in their claims that *all* diseases of whatever form are due to maladjustments, misplacements, or pressure of some kind, and that the cure of *any* disease may be accomplished by manipulation, but the fact remains that there are a limited number of cases that are benefited by physiotherapy. Therefore it is not compatible with even good sense to totally ignore a form of treatment which even though applicable to a limited number of abnormal or diseased conditions should form a part of our equipment for practice. In fact our patients should know that we *do* recognize the value of physiotherapy in selected cases, and that we *do* apply that treatment with an intelligence that is not used by either the osteopaths or the chiropractors. Therefore, it is entirely proper that our medical school should teach the subject, not from the standpoint of the ignorant enthusiast but from the standpoint of rational therapeutics, the instruction to cover its rational use *and point out its limitations.*

PROBABLY every doctor in Indiana who does any industrial work has had the experience of having his bill objected to by some liability insurance company. It doesn't make any difference how reasonable a bill may be, it is the habit of some insurance companies to offer objection. In fact objection seems to be a habit with them, without reference to reason. We doubt if any doctor presents a bill that is out of reason, and certainly it is getting to be rather rare for a doctor to attempt to charge excessively for services rendered in industrial cases. There are, however, any number of the better class of men in Indiana who are refusing to do industrial work because they will not wrangle with liability insurance companies over fees; nor will they put themselves to the inconvenience and expense of carrying a claim before the Compensation Board even though there is a reasonable possibility of having the claims allowed.

To our notion this whole subject of professional services in industrial cases is one for a committee on civic relations of our Indiana State Medical Association, but anyway the doctors of the State ought to unite on a policy of action which will bring about some justice, and which will prevent the liability companies from practicing the rank impositions upon medical men that are practiced at the present time. Just as long as the medical men stand for the brow-beating of insurance companies just as long will we fail to get anywhere in maintaining our economic independence. On the other hand, it is a pity that insurance companies cannot realize that the best services are the cheapest services, and when they antagonize the better trained and more experienced medical men they are forced to get their services from the ambulance chasing doctors and others who are willing to take work for what they can get out of it. The insurance company is getting the worst end of the bargain. The old adage "penny wise and pound foolish" applies in buying medical services just as it applies in buying anything else.

A VERY intelligent lay person recently made the remark, "Why do so many doctors attempt work for which they are not fitted by education or training, and why do so many doctors attempt to give advice concerning diseased conditions of which they know absolutely nothing?" The occasion for the remark was brought about as follows: A young boy suffering from partial deafness due to nonsuppurative otitis media, occasioned by two very large tonsils and an enormous bunch of adenoid tissue in the naso-pharynx, was operated by a general physician,

a very bungling and imperfect operation being performed, and afterward told that because the operation did not relieve the deafness the child had an incurable disease of the auditory nerve and should be placed in a deaf and dumb asylum. Aside from the bad surgery, which never should have been attempted by one so untrained, the patient had never had a functional examination to determine the nature of the deafness, and he never had the advantage of appropriate treatment which later restored the child to normal hearing though not bringing about a normal throat that had been mutilated by the bad surgery.

We certainly have no right to complain about the incompetency of the pseudo-medical cults and the damage done by them when we have so many men in the regular medical profession who will attempt anything in the line of medical or surgical treatment, even though not fitted by education or training for it, and the poor patient suffers in consequence. To top the thing off we have a habit of defending these chaps to the public when they do bungling work, and we seldom if ever bring them to task in our medical societies or in private for what is unquestionably malpractice. It is rank commercialism and the desire to secure fees which prompts a lot of ill trained men to attempt surgery and other work for which they are not fitted. We have the greatest admiration for the man who frankly says, "This work should be done by someone who is better qualified than I am to do it," and then proceeds to qualify himself for future work of that character by doing postgraduate work and receiving special training which fits him for that which previously he was ill prepared to do. We often wonder why the public places any more faith in the medical profession as a class than they place in the pseudo-medical cults, for it is such examples as the one cited, of which there are many similar occurring all over the land, which place us on the same plane with the medical pretenders. It certainly is time for introspection and then a house cleaning.

How Is It?

That when a doctor sends a bill to a fellow for $50 for two weeks' treatment pulling him through a critical case of pleuro-pneumonia he hollers for the police—and when the lawyer sends him a bill for the same amount for one hour's appearance in court he thinks he's getting off cheap?

That when a plumber, butcher, baker or milkman jumps into a creek or salt meadow to save an old soak from drowning himself, the papers hail him as a hero and Congress presents him with a life-saving medal—and when the doctor, through the use of brain and trained skill of a highly specialized order, working night and day, saves the life of a useful citizen, it is considered just duty done and no hero medal is awarded or even mention of the incident?

That when the tired doctor seeking needed relaxation like other folks, steals away for a few hours from his office to go to a show, or for a week-end in the country, he is grilled and toasted for neglecting his patients—and when a preacher, a lawyer, an engineer or any other professional man does the same thing, not an unfriendly word is said or unfriendly criticism made of the circumstance?

That when a baby is named by an appreciative mother after the family physician who brought it into the world, folks snicker, shrug their shoulders suspiciously and whisper, "I told you so"—and when it is named after a politician, soldier, captain of industry or a banker, it is accepted as a matter of course and no thought of suspicion is ever excited over the incident?

That when the doctor squeezes the hand of a pretty woman patient, or pinches her on the cheek, it is food for hostile gossip—and when the dominie does likewise it is just a token of spiritual solicitude for her health?

That when a fellow owes money to his doctor, he assumes an injured feeling when pressed to pay—and when pressed by his banker to pay is obsequiously deferential and polite?

That when no merchant on earth will give a fellow credit for a nickel's worth of merchandise, or call at his home on anything except a cash basis—the doctor will trust him and his family for hundreds of dollars' worth of service and never desert him while he is in need of help?

That when medical men ask an appropriation to protect a community from disease and death, legislators turn it down as a needless dissipation of public funds for "foolish medical experiments" and when a politician interested in promoting a new type of street sweeper, water cooler or office rugs asks a similar appropriation, he gets it P. D. Q.?

How Is It?

—Program LaPorte County Medical Society, October 13, 1922.

DEATHS

J. LEVI LORD, M.D., died at his home in Mays, October 17. Dr. Lord was 63 years old. He graduated from the Medical College of Indiana, Indianapolis, in 1882.

WILLIAM L. PARR, M.D., died at his home in Evansville, October 11, at the age of 43 years. Dr. Parr graduated from the Hospital College of Medicine, Louisville, Kentucky, in 1906.

REUBEN R. TIDRICK, M.D., of Bringhurst, died September 19 at the age of 81 years. Dr. Tidrick was a graduate of the Medical College of Ohio, Cincinnati, in 1866. He was not in active practice at the time of his death.

FRANK RANDOLPH, M.D., of Elkhart, was fatally injured when his automobile was struck by a freight train at Lagrange, September 24. Dr. Randolph was 57 years of age. He graduated from the University of Michigan Medical School, Ann Arbor, in 1892.

ROBERT F. PALMER, M.D., of Frankfort, died October 2 at the age of 67 years. Dr. Palmer was founder of the Palmer Hospital, at Frankfort, and had been at the head of that institution for twenty-three years. He was a graduate of the Hospital College of Medicine, Louisville, Kentucky.

JOSEPH B. LENNEY, M.D., died at his home in Crown Point, September 29, at the age of 59 years. He graduated from the Baltimore University School of Medicine, Maryland, in 1890. Dr. Lenney had been an invalid for many years and had not been in active practice.

HENRY E. GREENE, M.D., died at his home in Crawfordsville, October 2, at the age of 55 years. Dr. Greene graduated from the University of Michigan Medical School, Ann Arbor, in 1891. He was a member of the Montgomery County Medical Society, the Indiana State Medical Association and the American Medical Association.

NEWS NOTES AND PERSONALS

Anything in the line of physicians' supplies or equipment may be obtained from advertisers in THE JOURNAL OF THE INDIANA STATE MEDICAL ASSOCIATION. Patronize these advertisers, for it means a continuance of their advertising patronage, and the latter means a larger and better Journal for you.

THE Benton County Medical Society met at Fowler, October 4.

DR. J. E. RARICK has moved into his new building at Wolcottville, Indiana.

MISS ROSEMARY KELNER has been made superintendent of the Wabash County Hospital.

DR. H. N. OLIPHANT has purchased the interests of the late Dr. R. F. Palmer, in the Palmer Hospital at Frankfort.

DR. H. N. OLIPHANT, of Frankfort, has been made chief surgeon of the Toledo, St. Louis and Western railroad.

DR. E. C. GARBER, of Dunkirk, has been freed of the charge of malpractice brought against him by Mrs. Osborne of Muncie.

THE Washington County Medical Society held a meeting at Salem, October 5. A paper was presented by Dr. L. W. Paynter.

DR. J. H. TAYLOR, of Indianapolis, has resumed his work in pediatrics after an absence of four months in Europe and the Orient.

DR. C. R. SOWDER has announced the opening of his office at No. 7, The Cambridge, Indianapolis, limiting his practice to internal medicine.

DR. R. G. IKINS has announced the removal of his office to the fourth floor, Schultz Building, Fourth and Main Streets, Lafayette, Indiana.

DR. C. L. BARTLETT has resigned as head of the laboratories of the St. Joseph's Hospital, South Bend, to go to China for the Rockefeller Institute.

THE Carroll County Medical Society held a meeting October 13 at Flora. Dr. A. C. Arnett presented a paper. The meeting was preceded by a banquet.

THE Madison County Medical Society held a meeting at the Grand Hotel, Anderson, October 17. Dr. Frank Cregor, of Indianapolis, presented a paper.

DR. E. R. SMITH has announced the opening of offices in the Hume-Mansur building, Indianapolis. Dr. Smith has limited his practice to neuro-psychiatry.

THE Huntington County Medical Society gave a banquet, October 12, honoring Dr. C. H. Good, the new president of the Indiana State Medical Association.

THE Howard County Medical Society held a meeting at Kokomo, October 6. Dr. Robert Moore, of Indianapolis, presented a paper on "Auricular Fibrillation".

A JOINT meeting of the Bartholomew, Jackson and Jennings county medical societies was held at Seymour, October 5. Two papers were presented at this meeting.

DR. FLETCHER HODGES, of Indianapolis, who was injured in an automobile accident in January, has returned from a tour of Central Europe and the British Isles.

MISS INA GASKILL, of Indianapolis, was elected president of the Indiana State Nurses' Association at the meeting held at the Lincoln Hotel, Indianapolis, October 4.

THE Huntington County Medical Society held its regular monthly meeting at Huntington, October 3. A paper on "Consultations" was presented by Dr. R. A. Hoover, of Bippus.

A JOINT session of the American College of Surgeons and the Ohio Valley Medical Association will be held at Evansville, December 4, with headquarters at the Hotel McCurdy.

MISS MARY M. PETERSON, of Indianapolis, was re-elected president of the Indiana State League of Nursing Education at the meeting held at the Hotel Lincoln, Indianapolis, October 2.

DR. A. C. ARNETT announced the removal of his office to the fourth floor of the Schultz Building, Fourth and Main Streets, Lafayette. His practice is limited to surgery and gynecology.

DR. FRANK S. CROCKET has announced the removal of his office to the fourth floor, Schultz Building, Fourth and Main Streets, Lafayette, Indiana. His practice is limited to surgery, urologic and rectal.

DR. O. H. SMITH, Mt. Vernon, Iowa, has been commissioned to assist the China medical board by the Rockefeller Foundation. Dr. Smith formerly was head of the physics department of Cornell college.

THE Eighth District Medical Society held its annual meeting at Muncie, October 27. Dr. Frederick A. Besley, of Chicago, presented a paper on the subject of "The Problem of Sarcoma of the Extremities".

THE city board of health of Indianapolis has appointed Drs. J. L. Conley, Martha J. Smith, William Wise, Joseph Ward, F. R. Carter and E. T. Gaddy as full-time medical inspectors of the city schools of Indianapolis.

THE fifty-first annual meeting of the American Public Health Association was held at Cleveland, Ohio, October 16 to 19. Public health workers from all over the United States, Canada, Mexico and Cuba attended.

THE Seventh District Medical Society held a meeting at Indianapolis, October 26. Papers were presented by Drs. A. S. Jaeger, Indianapolis; O. T. Scamahorn, Pittsboro, Edgar F. Kiser, Indianapolis, and Hugh T. Patrick, of Chicago.

DR. G. W. H. KEMPER returned to his home at 1239 East Orange Grove Avenue, Pasadena, California, on October 24, after having made an extended visit in Indiana. Dr. Kemper attended the Muncie session of the Indiana State Medical Association.

DR. HARVEY MURDOCK has been permanently appointed to serve in the capacity of clinician at the Irene Byron Tuberculosis Hospital, Fort Wayne. Dr. Murdock succeeds Dr. F. H. Gebhardt, who has resigned to accept a position as state clinician for the state of Michigan.

THE Fountain-Warren County Medical Society held a meeting October 12 at Williamsport. Dr. Robert McGaughey, of Danville, presented a paper on "Medical Diagnosis of Appendicitis" and Dr. A. Merrill Miller, also of Danville, presented a paper, his subject being "Surgery of Appendicitis".

A NEW division, that of child hygiene, has been established as a part of the city health department of Indianapolis. Clinic stations will be established in different parts of the city, chiefly the poorer sections. Paul D. Kirby, until recently secretary of the Children's Aid Association, will be at the head of this new division.

THE Indiana Tuberculosis Association has made public a plan of interstate cooperation in anti-tuberculosis work in efforts to study methods used in combating the "white plague". Indiana, Michigan, West Virginia and Ohio will pool their executives' headquarters at the beginning of the annual tuberculosis Christmas seal sale, and will work cooperatively in this campaign.

THE Indiana Division of the American College of Surgeons will hold its annual meeting at Evansville, December 4 and 5, at the Hotel McCurdy, under the direction of Dr. James Y. Welborn, Evansville, chairman, and Dr. E. M. Shanklin, Hammond, secretary. The Ohio Valley Medical Association will merge their annual meeting with the College. A program of unusual interest and value has been prepared, beginning at 9 a. m., December 4, with a series of clinics at the Evansville hospitals in charge of the Evansville members of the College. Speakers on the scientific program include Dr. John B. Deaver of Philadelphia, Dr. Allen B. Kanavel of Chicago, Dr. Hugh Cabot of Ann Arbor, and Dr. Charles Reed of Chicago. A public meeting will be held on the evening of December 4, at which the Rev. C. B. Moulinier, president of the Catholic Hospital Association, and Dr. MacEachern, of Canada, will speak.

using only American-made synthetics, and referring to them at all times by their American names, as suggested by the Council on Pharmacy and Chemistry of the American Medical Association.

DURING October, the following articles have been accepted by the Council on Pharmacy and Chemistry for inclusion in New and Nonofficial Remedies:

Lederle Antitoxin Laboratories:
Diphtheria Toxin-Antitoxin (0.1L+.)

H. A. Metz Laboratories, Inc.:
Alumnol.

H. K. Mulford Company:
Hay Fever Timothy Pollen Extract-Mulford.

Parke, Davis & Company:
Normal Horse Serum-P., D. & Co.
Rabies Vaccine (Cumming)-P., D. & Co.

E. R. Squibb & Sons:
Acne Vaccine.
Colon Vaccine-Squibb.
Gonococcus Vaccine.
Meningococcus Vaccine.
Normal Horse Serum.
Pertussis Vaccine, Curative.
Pertussis Vaccine, Immunizing.
Purified Diphtheria Antitoxin (Anti-diphtheric Globulin).
Pneumococcus Vaccine.
Staphylococcus Vaccine.
Staphylo-Acne Vaccine.
Streptococcus Vaccine.
Tetanus Antitoxin Purified.
Typhoid Vaccine.
Typhoid Vaccine Combined, Immunizing.

KOSCIUSKO COUNTY MEDICAL SOCIETY

At a regular meeting held October 31, 1922, the Society adopted the following:

1. That House bill No. 267, which this society endorsed during the last session of the legislature, be reintroduced early at this coming session of the legislature.

2. That the following amendment (suggested by the Gibson County Medical Society) be added to House Bill No. 267:

"For the purpose of enforcing the provisions of this Act it is hereby made the duty of the Judges of the several Circuit and Superior Courts in this State, and they are hereby expressly granted power so to do, on proper showing made that any person in said State is practicing medicine without a license as defined herein, to grant temporary and permanent injunctions restraining and enjoining such persons from continuing so to practice medicine in this State until such person or persons have complied with the provisions herein provided."

Should House Bill No. 267 not pass, then we recommend that the above be reintroduced as an amendment to the old law.

3. That the Committee on Public Education (Page 367, October, 1922, issue of the *Journal of the Indiana State Medical Association*) be supplied with sufficient funds by the State society to carry on a thorough and well-balanced statewide education of the public through the press and otherwise.

4. That we all try to realize more keenly than ever that it is our uncured patients who grasp at the straw held out to them by the fanatic, the knave and the uneducated.

5. That a copy of this report (if approved by this society) be sent tomorrow by the secretary to both candidates for State Representative from our County and to our State Senator, with request that replies be sent to our secretary, stating their views on paragraphs 1 and 2.

6. That a copy of this report (if approved by this society) also be sent to the following:

a. Chairman of State Committee on Legislation.
b. Chairman of the State Committee on Public Education.
c. President of Indiana State Medical Association.
d. Secretary of the Indiana State Medical Association.
e. Journal of the Indiana State Medical Association.
f. Gibson County Medical Society.

TRUTH ABOUT MEDICINES

NEW AND NONOFFICIAL REMEDIES

TUBERCULIN (OLD) AND CONTROL FOR THE PIRQUET TEST.—A preparation of tuberculin-Koch (see New and Nonofficial Remedies, 1922, p. 293) marketed in packages containing three sealed glass tubes of tuberculin, each tube containing tuberculin sufficient for one test and three tubes of control material. Parke, Davis & Co.

TUBERCULIN OINTMENT FOR THE MORO TEST.—A preparation of tuberculin-Koch (see New and Nonofficial Remedies, 1922, p. 293) marketed in collapsible tubes containing 2 Gm. of an ointment consisting of 50 percent of tuberculin-Koch and 50 percent of anhydrous wool fat. Parke, Davis & Co., Detroit. —(*Jour. A. M. A.*, Sept. 9, 1922, p. 897.)

PYRAMIDON TABLETS, 5 GRAINS.—Each tablet contains pyramidon (see New and Nonofficial Remedies, 1922, p. 251), 5 grains. H. A. Metz Laboratories, Inc., New York.

NOVOCAIN SOLUTION 1 PERCENT AMPULES.—Each contains novocain, 0.06 Gm. (1 grain), sodium chloride, 0.036 Gm. (½ grain), and distilled water, 6 Cc. (90 minims). H. A. Metz Laboratories, Inc., New York.

AMPULES RADIUM CHLORIDE, 2 Cc. (United States Radium Corp.)—Radium element, 5 micrograms. For a discussion of the actions, uses and dosage of radium see New and Nonofficial Remedies, 1922, p. 252. United States Radium Corporation (formerly Radio Chemical Corp.), New York (see New and Nonofficial Remedies, 1922, p. 261).

AMPULES RADIUM CHLORIDE, 2 Cc.—United States Radium Corp. (Radium element, 10 micrograms). Radium Chemical Corporation, New York.

AMPULES RADIUM CHLORIDE, 2 Cc.—United States Radium Corp. (Radium element, 25 micrograms). United States Radium Corporation, New York.—*Jour. A. M. A.*, Sept. 23, 1922, p. 1049.)

FERRO-SAJODIN.—FERIOBEN.—Ferro-sajodin is a basic, ferric iodobehenate, containing at least 5 percent of iron and at least 24 percent of iodine. It has the actions of iodides and iron but is claimed to be more stable and palatable than ferrous iodide, not to injure the teeth or to disturb the gastro-intestinal tract and that it is free from a constipating tendency. It is claimed that ferro-sajodin is easily absorbed but slowly eliminated, thus insuring a more prolonged effect than that obtained from inorganic iodides and iron compounds. Ferro-sajodin is indicated in conditions in which iron and iodides are employed, such as anemia, rickets, syphilis, chronic bronchitis and arteriosclerosis with anemia. Ferro-sajodin is marketed only in the form of Ferro-sajodin tabets, 8 grains. Winthrop Chemical Co., Inc., New York.—(*Jour. A. M. A.*, Sept. 30, 1922, p. 1136.)

NOVOCAIN AND L-SUPRARENIN TABLETS "H".—Each tablet contains Novocain 0.06 Gm. (1 grain) and l-suprarenin synthetic 0.00006 Gm. (1/1000 grain). For a discussion of the actions, uses and dosage of procaine, see New and Nonofficial Remedies, 1922, p. 36. H. A. Metz Laboratories, Inc., New York.—(*Jour. A. M. A.*, Sept. 23, 1922, p. 1049.)

HAYFEVER TIMOTHY POLLEN EXTRACT-MULFORD.—The liquid is obtained by extracting the proteins from the pollen of timothy. For a discussion of actions, uses and dosage, see the article on Pollen and Epidermal Extracts, Preparations and Biologically Reactive Food Proteins, New and Nonofficial Remedies 1922, p. 232. This preparation is marketed in packages containing fifteen consecutive doses for a complete treatment and also in packages containing partial treatments only. H. K. Mulford Co., Philadelphia.

PURIFIED DIPHTHERIA ANTITOXIN (ANTIDIPHTHERIC GLOBULIN).—Concentrated diphtheria antitoxin (New and Nonofficial Remedies 1922, p. 280) is marketed in syringe containers of 1,000 units and in syringe containers of, respectively, 3,000, 5,000, 10,000 and 20,000 units. E. R. Squibb & Sons, New York.

NORMAL HORSE SERUM.—This product (New and Nonofficial Remedies 1922, p. 278) is also marketed in packages of one 10 Cc. syringe. E. R. Squibb & Sons, New York.—(*Jour. A. M. A.*, Oct. 21, 1922, p. 1427).

ALUMINUM COMPOUNDS.—Several aluminum compounds are official, including the ordinary alum. The acetate and acetotartrate of aluminum are used in the form of solutions described in the National Formulary. Aluminum compounds are used for their astringent action. They are not so astringent as the lead salts, but they may exert an irritant and even caustic action when used in the form of concentrated solutions or as "burnt" alum. Aluminum compounds are slightly antiseptic. Proprietary preparations of aluminum in combination with organic acids have been introduced with a view of utilizing the astringent and antiseptic properties of their components.

ALUMNOL.—The aluminum salt of betanaphtholdisulphonic acid. Alumnol is used as a mild antiseptic and, in concentrated solutions, as an irritant or caustic. It is used for destruction of the gonococcus in gonorrhea. H. A. Metz Laboratories, Inc., New York.

NOVOCAIN BASE.—Para-amino-benzoxydiethylaminoethane. The base contained in procaine. The action and uses of novocain base are the same as those of procaine (New and Nonofficial Remedies 1922, p. 36), but it is soluble in fixed oils. H. A. Metz Laboratories, Inc., New York.

NOVOCAIN NITRATE.—A brand of procaine nitrate-N. N. R. (New and Nonofficial Remedies 1922, p. 37). It has the actions and uses of procaine, but is compatible with silver salts. H. A. Metz Laboratories, Inc., New York.

DIPHTHERIA TOXIN-ANTITOXIN MIXTURE (0.1L+).—A diphtheria toxin-antitoxin mixture (New and Nonofficial Remedies 1922, p. 282) containing 0.1 lethal dose of diphtheria toxin neutralized with the required amount of diphtheria antitoxin. Marketed in packages of three vials, each containing 1 Cc.; also in packages of thirty vials, each containing 1 Cc. Lederle Antitoxin Laboratories, New York.

ACNE VACCINE.—Acne bacillus vaccine (New and Nonofficial Remedies 1922, p. 298) is marketed in packages of four syringes containing, respectively, 50, 100, 250 and 500 million killed bacilli; in packages of four ampules containing, respectively, 50, 100, 250 and 500 million killed bacilli (with a syringe); in vials of 5 Cc., 10 Cc. and 20 Cc., each cubic centimeter containing 1,000 million killed bacilli. E. R. Squibb & Sons, New York.

GONOCOCCUS VACCINE.—This product (New and Nonofficial Remedies 1922, p. 301) is marketed in packages of four syringes containing, respectively, 100, 250, 500 and 1,000 million killed gonococci; in packages of four ampules containing, respectively, 100, 250, 500 and 1,000 million killed gonococci (with a syringe); in vials of 5 Cc., 10 Cc., and 20 Cc., each cubic centimeter containing 1,000 million killed gonococci. E. R. Squibb & Sons, New York.

MENINGOCOCCUS VACCINE, CURATIVE.—Meningococcus vaccine (New and Nonofficial Remedies 1922, p. 302) is marketed in packages of four syringes containing, respectively, 100, 250, 500 and 1,000 million killed meningococci; in packages of four ampules containing, respectively, 100, 250, 500 and 1,000 million killed meningococci (with a syringe); and in vials of 5 Cc., 10 Cc. and 20 Cc., each cubic centimeter containing 1,000 million killed meningococci. E. R. Squibb & Sons, New York.

PERTUSSIS VACCINE, CURATIVE.—Pertussis bacillus vaccine (New and Nonofficial Remedies 1922, p. 303) is marketed in packages of four syringes containing, respectively, 100, 250, 500 and 1,000 million killed bacilli; in packages of four ampules containing, respectively, 100, 250, 500 and 1,000 million killed bacilli (with syringe); and in vials of 5 Cc., 10 Cc. and 20 Cc., each cubic centimeter containing 2,000 million killed bacilli. E. R. Squibb & Sons, New York.

PERTUSSIS VACCINE, IMMUNIZING.—Pertussis bacillus vaccine (see New and Nonofficial Remedies 1922, p. 303) is marketed in packages of three syringes containing, respectively, 500, 1,000 and 1,000 million killed bacilli; in packages of three ampules containing, respectively, 500, 1,000 and 1,000 million killed bacilli (with a syringe). E. R. Squibb & Sons, New York.

PNEUMOCOCCUS VACCINE.—This product (New and Nonofficial Remedies 1922, p. 304) is a suspension of killed pneumococci Types I, II, III and Group IV in equal proportions. Marketed in packages of four syringes containing, respectively, 100, 250, 500 and 1,000 million killed pneumococci; in packages of four ampules containing, respectively, 100, 250, 500 and 1,000 million killed pneumococci (with syringe); and in vials of 5 Cc., 10 Cc. and 20 Cc., each cubic centimeter containing 5,000 million killed pneumococci. E. R. Squibb & Sons, New York.—(*Jour. A. M. A.*, Oct. 28, 1922, p. 1519).

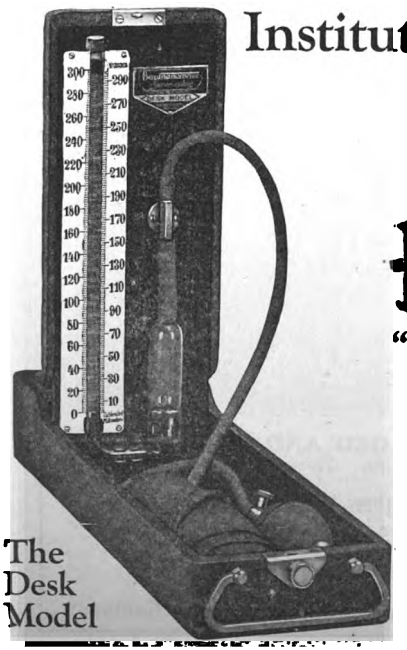
PROPAGANDA FOR REFORM

AFSAL.—Afsal is being marketed by S. Lewis Summers. It is stated to be "diacetyl methylene disalicylic acid". The product was formerly marketed by the Organic Chemical Manufacturing Co. (S. Lewis Summers, president) as Urasol. Urasol was one of a number of the "Forma-Sol Compounds" marketed by the Organic Chemical Manufacturing Co. and stated to be compounds of methylene disalicylic acid. Sollmann reported in 1908 in an investigation made for the Council of Pharmacy and Chemistry that he had been unable to confirm the claims that were made for these compounds. A subsequent examination confirmed Sollmann's findings.—(*Jour. A. M. A.*, Sept. 7, 1922, p. 1264).

SPAHLINGER'S TREATMENT FOR TUBERCULOSIS.—Spahlinger, according to reports, was a lawyer who abandoned his profession for research work. He appears now to be connected with the Bacterio-Therapeutic Institute, Geneva. According to an article by Spahlinger, the treatment utilized either one or both of two therapeutic principles depending on the nature of the infection. In acute cases, passive immunization with special serums is used. In chronic afebrile pulmonary cases, in non-pulmonary forms and in cases "predisposed to" tuberculosis, active immunization with special antigens is employed. No definite information in regard to the preparation of the product is given. Reports that the British Red Cross is to purchase the treatment are unconfirmed. Reports that the Rockefeller Institute had made an offer to secure the rights for the product in the United States proved unfounded. The exact nature of the Spahlinger treatment does not appear to have been divulged, the treatment is in the experimental stage and the reported results lack confirmation.

ARSENAURO.—Some ten to twenty years ago this preparation had considerable vogue. It is believed to be similar in composition to solution of gold and arsenic bromid of the National Formulary. This contains bromid of gold and arsenic acid. Gold preparations were at one time believed to have therapeutic value, particularly as "alteratives". They have proved inefficient and have been discarded.—(*Jour. A. M. A.*, Oct. 21, 1922, p. 1446).



CLEARO.—This was a "patent medicine" sold by C. E. McCuistion, Dallas, Texas, doing business as "The Clearo Co.", as a cure for tuberculosis, asthma, bronchitis, hayfever, serious throat and lung troubles. An investigation by the post office authorities led to the conclusion that the product was worthless for the purposes claimed and that the Clearo Co. was engaged in a scheme for obtaining money through the mails by means of fraud. The Clearo Co. has been denied the use of the mails.—(*Jour. A. M. A.*, Oct. 21, 1922, p. 1445).

PRESENT STATUS OF THE USE OF DRUGS IN HEART DISEASE

(Continued from page 390)

tachycardia, the action of quinidin is uncertain or useless. Occasionally, premature beats can be abolished, but they recur on stopping the drug. Quinidin should not be used indiscriminately for arrhythmia, and should not be administered simply because a patient with heart disease is not doing well, his physician having heard vaguely of the new cardiac therapy with quinidin. It is in auricular fibrillation of recent origin, without heart failure or pronounced mitral stenosis, that quinidin therapy seems at present to be especially indicated.

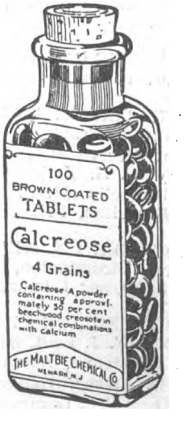
(Continued on Page viii)

Next Annual Session, Terre Haute, Sept. 26, 27, 28, 1923. List of Officers and Committees on Adv. Page 1.
Entered as Second Class Matter, January 20, 1908, at the Postoffice at Fort Wayne, Indiana, under Act of Congress of March 3, 1879. Accepted for mailing at special rate of postage provided for in Section 1103, Act of October 3, 1917, authorized October 18, 1918.



CALCREOSE

IN PULMONARY TUBERCULOSIS

CREOSOTE EFFECT MAY BE OBTAINED WITHOUT UNTOWARD SYMPTOMS on the gastro-intestinal tract; no nausea, vomiting, gastric distress or irritability by using

CALCREOSE (Calcium creosotate) is a mixture containing in loose chemical combination, approximately equal weights of creosoto and lime. Patients do not object to taking CALCREOSE, even in large doses for long periods of time.

THE INDIANA STATE MEDICAL ASSOCIATION

Next Annual Session, Terre Haute, September 26, 27 and 28, 1923.

OFFICERS AND COMMITTEES FOR 1923

President ..... Charles H. Good, Huntington
1st Vice-President.....Wilson T. Lawson, Danville
2d Vice-President.....John H. Reed, Logansport
3d Vice-President.....Charles S. Bryan, Vincennes
Secretary-Treasurer.....Charles N. Combs, Terre Haute
Editor THE JOURNAL.....Albert E. Bulson, Jr., Fort Wayne

SECTION OFFICERS

Surgical Section—A. P. Roope, Columbus, Chairman; G. B. Jackson, Indianapolis, Vice-Chairman; Merrill S. Davis, Marion, Secretary.

Medical Section—B. R. Kirklin, Muncie, Chairman; W. A. Fankboner, Marion, Vice-Chairman; C. G. Beall, Fort Wayne, Secretary.

Section on Ophthalmology and Otolaryngology—C. J. Adams, Kokomo, Chairman; Harry Boyd-Snee, South Bend, Vice-Chairman; E. M. Shanklin, South Bend, Secretary (re-elected).

DELEGATES TO THE AMERICAN MEDICAL ASSOCIATION

For one year (term expires December 31, 1923; Albert E. Bulson, Jr., Fort Wayne; George F. Keiper, Lafayette. Alternates, E. H. Griswold, Peru; Harry Elliott, Brazill.

For two years (term expires December 31, 1924): Joseph Rilus Eastman, Indianapolis. Alternate, M. R. Combs, Terre Haute.

COUNCILORS

Chairman—E. M. Shanklin, Hammond.

District	Term Expires
1st—J. H. Willis, Evansville	Dec. 31, 1923
2d—Joseph Smadel, Vincennes	Dec. 31, 1924
3d—Walter Leach, New Albany	Dec. 31, 1922
4th—A. G. Osterman, Seymour	Dec. 31, 1923
5th—Joseph H. Weinstein, Terre Haute	Dec. 31, 1924
6th—G. H. Smith, Newcastle	Dec. 31, 1925
7th—S. E. Earp, Indianapolis	Dec. 31, 1922
8th—E. M. Conrad, Anderson	Dec. 31, 1924
9th—William R. Moffit, Lafayette	Dec. 31, 1922
10th—E. M. Shanklin, Hammond	Dec. 31, 1922
11th—C. S. Black, Warren	Dec. 31, 1924
12th—W. D. Calvin, Fort Wayne	Dec. 31, 1922
13th—J. B. Berteling, South Bend	Dec. 31, 1922

COMMITTEES FOR 1922-1923

COMMITTEE ON ADMINISTRATION AND MEDICAL DEFENSE—Permanent Members, President (Charles H. Good, Huntington); and Editor and Manager of THE JOURNAL, Albert E. Bulson, Jr., Fort Wayne. George R. Daniels, Marion (term expires December 31, 1925); E. M. Shanklin, Hammond (term expires December 31, 1924); David Ross, Indianapolis (term expires December 31, 1923).

COMMITTEE ON PUBLICATION—The Council and Albert E. Bulson, Jr., Fort Wayne.

COMMITTEE ON PUBLIC POLICY AND LEGISLATION—Frank W. Cregor, Indianapolis, Chairman; George R. Daniels, Marion; E. E. Evans, Gary; C. H. McCaskey, Indianapolis; J. W. Sluss, Indianapolis; H. O. Bruggeman, Fort Wayne; O. T. Brazelton, Princeton.

COMMITTEE ON MEDICAL EDUCATION—B. D. Myers, Bloomington, Chairman; M. F. Porter, Sr., Fort Wayne; Edmund D. Clark, Indianapolis.

COMMITTEE ON HOSPITAL STANDARDIZATION—E. J. Lent, South Bend (term five years); W. H. Stemm, North Vernon (term four years); A. E. Sterne, Indianapolis (term three years); G. D. Miller, Logansport (term two years); J. H. Weinstein, Terre Haute (term one year).

COMMITTEE ON AUTOMOBILE INSURANCE—J. N. McCoy, Vincennes, Chairman; A. F. Knoefel, Terre Haute; R. D. Blount, Valparaiso; C. S. Bryan, Vincennes.

COMMITTEE ON NECROLOGY—George G. Richardson, Van Buren.

COMMITTEE ON CREDENTIALS—U. G. Poland, Muncie.

COMMITTEE ON SCIENTIFIC WORK—Wm. H. Kennedy, Indianapolis, Chairman; Merrill S. Davis, Marion; Charles G. Beall, Fort Wayne; E. M. Shanklin, Hammond.

COMMITTEE ON INDUSTRIAL AND CIVIC RELATIONSHIP—C. H. McCully, Logansport, Chairman; F. S. Crockett, Lafayette; A. M. Hayden, Evansville; H. W. MacDonald, Newcastle; Charles R. Sowder, Indianapolis.

COMMITTEE ON ARRANGEMENTS—M. R. Combs, Terre Haute, General Chairman; J. R. Yung, Terre Haute, Chairman Ladies' Entertainment Committee; Leon Barbazette, Terre Haute, Chairman Entertainment Committee; A. M. Mitchell, Terre Haute, Chairman Finance Committee; A. F. Knoefel, Terre Haute, Chairman Hotel and Housing Committee; F. G. McCarthy, Terre Haute, Chairman Golf Committee; J. H. Weinstein, Terre Haute, Chairman Publicity Committee; C. N. Combs, Terre Haute, Chairman Meeting Place Committee. All members Vigo County Medical Society, Reception Committee.

THE TREND OF NEUROLOGICAL SURGERY*

CHARLES H. FRAZIER, M.D.
PHILADELPHIA

Neurological surgery in the past decade has made notable strides and its recognition as a specialty has been fully justified and imperative. The time-consuming study of the individual case and the time-consuming operation are prohibitive of practice in other fields. In claiming for neurological surgery a field separate and apart from that of general surgery, I have not in mind the mastery of technical details; but the necessary understanding of the physiology, anatomy and pathology of the nervous system and of the knowledge of when and how to deal with the problems and complications exclusively those of intracranial operations. Before this assembly it seems more appropriate to review the field of neurological surgery as a whole, rather than to dwell at length and in detail upon one specific problem, and first a word as to meningitis.

Meningitis, suppurative meningitis, is not an operable condition. Let us admit once and for all that one cannot drain the subarachnoid space as one would the pleural and peritoneal cavity, and abandon what I have always regarded as a futile practice, the introduction of drainage tubes into the basal cisterns, an operation which every once in a while finds a new advocate. We must wait patiently for the time when serum therapy in the treatment of pyogenic infection generally has become effective.

I am disposed to believe that as a sequella of certain infectious diseases, particularly influenza and whooping cough, there develops a meningitis of the serous type, which in its clinical expression may simulate brain tumor insofar as it gives rise to signs of increased intracranial pressure and occasionally to focal phenomena. In my clinic there have been several cases of this kind, where the subsidence of symptoms and ultimate recovery following a decompressive operation may be offered as contributory evidence of this hypothesis.

In the management of intracranial trauma, and I refer chiefly to the severe contusions and lacerations, with or without fractures, we have been forced to realize that only in the minority of cases can we, by active surgical means, reduce the mortality. We have learned by experimental study and by the examination of autopsy material that apart from the hemorrhages and lacerations an essential process in the pathology of brain trauma is an edema, a definite increase in the water content of the brain. The precise origin of the edema is still a matter of speculation, but of its presence there is no doubt, nor is there any doubt that it is responsible, as it spreads rapidly to the brain stem, for many of the fatal cases. Only by recognition of this fundamental process can we appreciate the inevitable failure to relieve the symptoms and to save the patient's life by a decompressive operation, an operation all too frequently and indiscriminately practiced in intracranial trauma. Subtemporal decompression will save life occasionally, where the increase of intracranial pressure indirectly interferes with the circulation of the medulla, but when the medulla is itself the seat of the lesion, a subtemporal decompression will be of no avail.

We have added recently to our therapeutic agents for the treatment of certain intracranial complications sodium chloride as a dehydrating agent. But unfortunately it has not proven effective in checking an advancing edema. *A priori* one might have presumed that, in the treatment of an edema, a dehydrating agent would be in the nature almost of a specific, but experience has shown us that, while the administration of sodium chloride promotes the absorption of fluid in striking fashion, when the fluid is free in the ventricles or in the subarachnoid space, we must acknowledge its inefficacy as now used in saturated solution or half strength when the fluid is tissue bound, as in a diffuse edema. Here is a fruitful field for investigation and experimental study.

However, sodium chloride therapy, intravenously or by mouth, has proved of immeasurable value under certain circumstances and has become an accepted agency in our management of certain intracranial problems; in reducing brain volume when exploring the brain under

(*) Address on Surgery presented before the Surgical Section of the Indiana State Medical Association at the Muncie session, September, 1922.

extreme tension; when closing the wound under similar circumstances; as a means of relieving the terrific headache of a tight brain; or as a method of determining whether a tense cerebral hernia is due to a large tumor or to a dilated ventricle.

As infections and trauma in the domain of neurological surgery are, relatively speaking, minor issues, so the major issue may be said to be brain tumor, and let me preface my remarks on this chapter of brain surgery by reminding you that the time has come when either for purposes of discussion or for reviewing the possibilities of surgical therapy the subject must be subdivided. Just as the term "indigestion" or "dyspepsia" has been abandoned as too general and we now refer specifically to the lesion of the stomach at fault, whether ulcer, carcinoma, dilatation or what not, so with brain tumors the time has come when we must, for the purpose of discussion, recognize different problems according to the nature and the location of the tumor. Too often I think the general practitioner throws up his hands in despair when brain tumor is suspected and allows the lesion to continue with its inevitably fatal consequences if unexplored. He should realize that there are in the brain, as elsewhere, tumors that are distinctly operable as well as those distinctly inoperable, and that without exploration it is often impossible to determine to which of these classes the tumor may belong. Hence, wherever localization is possible, the patient is entitled to an exploratory operation. An endothelioma with its origin from the meninges, with its firm encapsulation as a rule is readily removed; so too the enchondroma, the osteoma, the psammoma and occasionally the tuberculoma.

The fibro-neuroma of the acoustic nerve is a relatively benign lesion, as a rule presents a characteristic clinical picture and is therefore readily localizable, not difficult of approach, and, when not too far advanced, not difficult of removal. Here are very definite and distinct groups, presenting different clinical pictures, offering different surgical problems and each with its percentage of operative risk and eventual recovery. And quite distinct and apart from these are the gliomata, infiltrating and diffuse, only occasionally encapsulated, usually deep seated, often difficult of localization in the early stages and often impossible to remove *in toto*. But even with this unfavorable surgical type there are extenuating circumstances. As they increase in size, the central portion undergoes degenerative changes and this degenerative process with cell necrosis spreads toward the periphery until the tumor is converted into a large cystic cavity; occasionally a remnant of the tumor may be found as a nubbin on the cyst wall.

Such was the case in a lad of 9 (File No. 65844) who six months prior to his admission to the university hospital developed at first twitching about the right side of the face and then general convulsions. Because of the hemiparesis, localization was not difficult and the exploration revealed a large cyst. The evacuation of the cyst gave entire relief. A year later the patient returned with signs of recurring pressure and with our knowledge of the topography of the cyst, it was a simple matter to evacuate it, again with gratifying results.

Therefore, while fully recognizing the surgical limitations of these gliomatous tumors, and our inability to practice complete extirpations in many instances, let us not abandon them as utterly hopeless. Beside spontaneous metamorphosis from a solid to a cystic tumor, I am constrained to believe that the progress of the growth may be retarded in certain occasions by radium therapy. While not prepared to quote end results, as we have a number of cases still under observation and treatment, I am convinced that in certain of these life is being prolonged, perhaps eventually to be saved, by the combined effects of surgery and radium therapy.

We have almost outlived the era when the suspicion of syphilis was attached to most brain lesions and for weeks or months iodides and mercury were administered in enormous doses. But an occasional example of this old-time tradition may be offered in evidence that the lesson has not been learned. A few months ago I removed a large encapsulated endothelioma from a patient who for five years had been treated, now casually, now intensively, as a syphilitic, despite the fact that the Wassermann reaction had always been negative. The patient was almost completely hemiplegic, and, had it not been that painful convulsive movements developed, the true nature of his lesion probably never would have been revealed.

The frequency of convulsive seizures, as an expression of brain tumors, is not usually appreciated. In approximately 10 percent do we find convulsions as a conspicuous, and sometimes for a considerable time the only, manifestation of tumor. These convulsive seizures may be Jacksonian in type or general; in the former instance when the tumor is in or encroaches upon the motor zone, in the latter when there is a secondary hydrocephalus. As a rather striking example of the former, I may cite the case of a patient who for ten years had been treated as an epileptic subject. Only three months prior to my first observation did signs of increased pressure develop, with attacks of headache and occasional vomiting. The diagnosis and the localization of the tumor was readily confirmed in this case by the roentgenogram, which showed with extraordinary clearness the shadow of the calcified tumor. In this case

there was perhaps some justification for the late verification of the diagnosis since, following the attacks, there was no weakness of the extremities. This is a rather characteristic feature of the focal convulsions of brain tumor, and should always arouse one's suspicion. The following abstract of a clinical record tells the story: While at the onset of his illness the patient had a violent pain in the right arm, which, with the face, began to twitch, he did not lose consciousness but for several days he was unable to talk and was partially hemiplegic. From these symptoms he soon completely recovered. An interval of two years elapsed before he had a second attack, differing from the first in that the arm alone was involved. From then there was a gradual loss of power until, when I saw him five years after the onset of his illness, he had become almost completely hemiplegic. A tumor of considerable dimensions was found and readily removed. This is a very instructive clinical record.

A study of the life history of brain tumors is intensely interesting. The impression prevails very generally I think that practically all brain tumors are malignant and as malignant growths elsewhere they run their course in one or two years. Far as this is from the truth, a rather striking feature of the life history of brain tumors is the variation in the rate of growth, and yet because among other things one finds great variations in the rate of growth and because of periods of latency, the precise duration of the growth in the individual case is a matter of conjecture. As an illustration of this latent period I am reminded of a patient in the person of a physician who, until within six weeks of the date of admission had been, so far as he knew, absolutely symptom free. The suddenness of onset and other phenomena pointed suspiciously to encephalitis lethargica. Before an exploration was even considered the patient died and the autopsy revealed a huge infiltrating glioma extending almost from base to cortex. Sometimes, I fear, forgetting these latent periods we are too critical in our attitude toward the physician, who brings his patient to the surgeon when the growth has attained great proportions, and reached perhaps an inoperable stage.

The diagnosis of brain tumor is not as a rule difficult, although one occasionally, as in the case above described, may be misled. To make the diagnosis on the signs of intracranial tension, headache, papilloedema, and vomiting, avails us little since this triad of pressure symptoms gives no clue as to localization. Furthermore, like the metastatic lesions of a carcinoma, it usually betokens a late stage of the disease.

Insofar as concerns tumors of the occipital lobe and parietal lobes, of the zones representing the motor, visual, auditory and speech centers, localization is readily made. Lesions of the frontal lobe still present problems and confusion with the psychoses cannot be eliminated in the absence of signs of pressure. While the right temporal lobe was once looked upon as a silent zone, repeated perimetric studies will show, in a considerable percentage of cases, homonymous field defects.

Because of the long course of the visual pathway, from the calcarine cortex of the occipital lobe to the retina, frequent observations of the visual fields, according to the methods of Walker, give us very important bits of evidence in the localization of brain tumors. There are the lesions of the occipital lobe represented by the homonymous heminopsia, the lesions of the temporal lobe represented by homonymous defects in the upper or lower quadrant (according to whether the ventral or the dorsolateral bundles are encroached upon by the growth), the typical bitemporal hemianopsia of lesions of the chiasm or a varied picture as of a lesion involving one or both optic tracts posterior to the chiasm. The importance of careful repeated studies of the fields may be illustrated in the clinical record of this case.

W. R., aged 28 years, was referred to my service as a brain tumor case. Our first examination revealed, in addition to a marked choking of discs, a general contraction of the fields due to a beginning optic atrophy. The patient was so dull and lethargic that careful perimetric studies were out of the question. After a subtemporal decompression he was transformed from a bedridden to an ambulant case with relief of headache and subsidence of his papilloedema. Subsequent examination revealed a homonymous hemianopsia and because of this and other findings, the tumor at first was localized in the occipital lobe. Later, however, there developed on the other side quadrant defects; these could not be ascribed to an occipital lobe lesion, but could be explained only on the basis of a lesion of the optic tract behind the chiasm. This proved to be the correct interpretation of the visual findings. In this particular case the field defects were not due to the direct pressure of the tumor upon the optic tracts but to the pressure upon the tracts of the internal carotid artery and the middle cerebral artery. The tumor was posterior to the chiasm and as it increased in size the pressure of the arteries caused marked grooving or pressure defects of the tracts, one tract being almost completely bisected. This mechanical effect of arterial pressure upon the tracts, though perhaps infrequent, must be taken into consideration in lesions of this neighborhood, and when associated with evidences of dyspituitarism, point rather to an extrasellar, post chiasmal lesion than to a primary intrasellar growth.

Studies of the topography of the ventricles by roentgenogram after air injection, as proposed

by Dandy, is among the more recent contributions to localization of tumors. While in certain cases it may give contributory evidence, the possibilities of error of interpretation are such that the evidence should be used only as confirmatory of the neurological findings. The ventriculogram may show collapse of an anterior or posterior horn of one ventricle, complete obliteration of one lateral or of the third ventricle, or displacement of both ventricles to the right or left. These are all positive findings that may have significance, but unfortunately the ventricles are deep seated and tumors that originate in or adjacent to the ventricles are usually infiltrating gliomata, that belong to the inoperable group, so that the findings of the ventriculogram will prove, I fear, often of little practical value. The localization of deep-seated growths is one thing; their removal, without unwarranted mutilation or sacrifice of brain tissue and function, another. To convert a patient into a vegetative subject with a brief expectation of life, even though the tumor be removed, may hardly be called a surgical triumph. After all, we, as neurological surgeons, must recognize our limitations in dealing with brain lesions and while the ventriculogram frequently may prove disappointing as of practical moment, we should continue to employ it in selected cases at least until we can evaluate its usefulness in the localization of what may be judiciously considered operable growths.

Ignorant as we still are of the etiology of trigeminal neuralgia, we are masters of the situation insofar as treatment is concerned. Like the herniorrhaphies of the general surgical clinic, operations for trigeminal neuralgia are the commonplaces of the neurosurgical clinic. With the mortality reduced almost to zero, my records show a series of 142 consecutive operations without a fatality, and in the last 234 cases, only one. The operation from the standpoint of cosmetic effect and relief of symptoms is so eminently satisfactory that there is no need of discussion or criticism. We should turn our attention to the investigation of the etiology of the major neuralgias about which we know nothing and to a better understanding of the causes of the atypical neuralgias, so varied in their expressions, so difficult of interpretation as to their origin, and so baffling as to treatment.

The surgery of the pituitary body, or the hypophysis, is one of the later ventures of intracranial surgery and I wish to present to you as briefly as I can my present attitude toward this problem; I say present attitude because we are still in the formulative stage and what may be a viewpoint today may be modified tomorrow. Withal, certain principles, as a result of frequent observation and many operations, are pretty definitely established.

The perplexities which confront the surgeon in his decision as to operation or as to the method of operation, are many and not the least of these is the absence of uniformity in the physical findings of pituitary disorder, especially in the diversity of the visual disturbances. It must be assumed in the first place that the surgeon's responsibility begins only when there is a pituitary tumor, which by pressure on chiasm or optic tract, threatens the patient's vision, and I may say by way of parenthesis, as emphasizing needless delay, that over 50 percent of my patients have, at the first examination, been found already totally blind in one eye. The structural changes of glandular origin either of the acromegalic or dystrophic type are not to be considered as among the indications for operative attack.

In our approach to the pituitary we must elect either the transphenoidal operation or the intracranial transfrontal approach. Taking for example a specific case: This patient, middle aged, has for several years noticed that the vision of one-half the field of the right eye was obscured. The precise nature of the lesion, not appreciated, she drifted on and little by little the vision of the eye was impaired and then totally lost. In course of time vision of the left eye became impaired and she began to have paroxysmal headaches. She then became alarmed and found her way to the neurosurgical clinic. An examination revealed total atrophy of the right optic nerve, beginning atrophy of the left, an hemianopsia, a decidedly excavated sella, and a low metabolic rate. Under these circumstances, I invariably perform a transphenoidal operation, remove the floor of the sella turcica, evacuate the contents partially with forceps and curette and before the patient is discharged, prescribe a course of radium therapy to be repeated at intervals of six months. That is a perfectly simple problem, and should admit of no dispute. The risks of this operation are almost negligible; I have had no fatalities since 1919, and the freedom from operative risks is, after all, the most important factor when considering the choice of operation.

To cite another case, take for example this boy, 17 years of age, dwarfed in growth, with partial optic atrophy, an enormous sella with disappearance of posterior clinoid processes. The x-ray showed in outline a suprasellar calcified tumor, as large as a hen's egg. The approach to this tumor was made, naturally, by a transfrontal exposure. The tumor proved to be a large cyst with a thick calcified wall. The cyst wall was partially excised, its contents evacuated, returning vision improved and with it the somnolence and headache. In other words, when there is evidence of an extensive intracranial lesion, the indications as to method of approach are equally clear. But there are many

cases where the symptoms are difficult of interpretation as to whether the lesion is wholly within the confines of the sella or largely extrasella, as in tumors of the pouch of Rathke or of the hypophyseal duct, and in doubtful cases the first attack should be transphenoidal, with the realization that should there be recurrence or should evidence develop later pointing more clearly to a suprasellar growth, a second attack may be made by the intracranial route.

The evaluation of the surgical methods of treating pituitary tumors must be based on two factors, the operative risk and the period of relief. Since radical extirpation of the sella contents is not feasible, recurrence of visual disturbances must be reckoned with. And it is for this reason that as part of our routine technic radium therapy is prescribed as an essential phase of the treatment. The influence of radium upon pituitary adenomata has been established. From my own experience I could cite an example of the subsidence of recurring symptoms after operation under radium therapy as well as an example of the enlargement of the visual fields under radium therapy alone. Because of the effect of pituitary lesions in distorting the visual fields, these lesions afford an excellent opportunity to observe the effect of whatever plan of treatment one may elect. Within the year I have had under observation a young lady with the incipient signs of pituitary disorder. There was as yet no expansion of the sella, but the cut in the fields was more than suggestive and after a course of three treatments there has been such a decided enlargement of the fields that the necessity for operation has, for the time being, been averted.

In conclusion, if we may judge from the stride of the past decade, greater achievements in neurological surgery may be anticipated in the future. Of this there can be little doubt. And while in part these achievements will be the product of refinements and contributions to technic, they will, I believe, in larger measure be the result of greater accuracy in diagnosis and in localization. The surgeon enjoys an unusual opportunity and should recognize this obligation in the course of his operative experience, to make substantial contributions to the localization of brain lesions. Just as much that we learned of the perverted physiology of the thyroid gland has been derived from the results of surgical intervention, so with the perverted physiology of the brain and the hypophysis, the surgeon is offered a large and fertile field for constructive contributions.

ENDOCRINOLOGY IN ITS MEDICAL ASPECTS*

G. W. McCASKEY, M.D.
FORT WAYNE

Clinical endocrinology is the medical application of the science of internal secretions and the glands which produce them. It is not too much to say that these internal secretions completely dominate growth, determining the dimensions and architecture of the body and each of its component parts, regulate the speed of the life processes and are essential to every function of every organ and tissue of the animal body. Furthermore, as will be shown later, the complete loss of function of any one of several of these endocrine glands is uniformly fatal, often within a few days, while any great increase or decrease in functional activity may cause slight or severe disturbance of health or structure, or both.

The potency of some of these secretions is almost unbelievable. For instance, it has been shown that epinephrin will have a perceptible effect upon smooth muscle fibres in dilutions of about one to a billion, or one grain of the substance to fifty tons of fluid (Hoskins). It is not difficult to understand that a very profound influence would be produced upon nutrition and the function of the body organs by the continuous introduction into the circulation of even extremely minute quantities of such substances as this on the one hand or their withdrawal on the other.

The quantity of these secretions furnished under physiologic conditions is astonishingly small: e. g., there is secreted 0.0002 of a milligram of epinephrin per kilogram of body weight per minute. This would be equivalent in an individual weighing 70 kilograms, or 150 pounds, to about 20 milligrams or about 0.3 of a grain per day.[1]

Within a very few years this subject has assumed vast clinical importance. In attempting to review my own experience and the literature of the subject with the view of correlating the facts into a related and harmonious whole I am reminded of a remark attributed to Ralph Waldo Emerson. When asked by one of his admirers why he did not write a system of philosophy he is said to have replied that the world was still some centuries too young for such a task. While I hope that this is not literally true of the subject in hand, its consummation is without doubt somewhat distantly removed.

Let us make a rapid survey of the component elements of the endocrin system. There are

(*) First paper of symposium on Endocrinology presented before the Indiana State Medical Association at the Muncie session, September, 1922.

(1) Hoskins, Endocrinology and Metabolism. Vol. I. P. 17.

several of these endocrin organs about the function of which there is no question, while there are a number of others about which there is doubt.

The following is a list of the endocrin organs, actual and possibly spurious:

1. The thyroid gland,
2. The parathyroid gland,
3. The pituitary gland,
4. The suprarenals,
5. The ovaries,
6. The testes,
7. The pineal gland,
8. The stomach,
9. The duodenum,
10. The liver,
11. The pancreas,
12. The thymus,
13. The prostate,
14. The placenta,
15. The mammary glands,
16. The carotid gland, and certain other collections of chromaphin tissue which are accessory to the medulla of the suprarenals.

It is obviously impossible, within the scope of a society paper, to discuss with any degree of completeness the many glandular organs above listed. Such a task would require several volumes. It occurred to me that I might compress the best general view of the subject into the smallest space by selecting some salient characteristic phenomena of a few of the most important endocrin glands and dwell upon these and their possible relationship to other endocrin organs, in the hope that I might touch the high points, so to speak, of the general subject.

The thyroid easily occupies the center of clinical attention in the field of endocrinology. Its study has been facilitated by its very large incidence in all civilized countries and its easy accessibility for the purpose of study. Its importance in the animal economy is recognized by everyone. The literature of this gland alone is enormous and in a rapid survey such as the present only a few facts can be considered for the purpose of presenting a general viewpoint in connection with the other endocrin organs.

Its most conspicuous and probably its most important function is the regulation of the activities of the metabolic processes of the body. These activities are dependent upon and indicated by the quantity of oxygen utilized as they are essentially processes of oxidation.

The identification and isolation and chemical study of thyroxim, the active hormone, or perhaps it will be safer to say one of the active hormones of the thyroid gland, by Kendal, marks an epoch in the history of endocrin disease. Within very wide limits the oxidation processes of the body are dependent upon the quantity of thyroxim which the tissue cells contain. These general facts of course, with the exception of those relating to thyroxim, have been fully recognized for a number of years but owing to the difficulty attending their clinical determination they were not available outside of well-equipped hospitals or institutions. The presentation to the medical profession by J. F. Benedict of his portable metabolism apparatus furnished the opportunity for the general utilization of these diagnostic data.

It is customary to estimate the oxygen requirement on the basis of a definite quantity of oxygen absorbed per unit of surface measurement of the body in a unit of time. While any other standard could be used this is done in clinical study, as well as scientific investigations, by taking as a standard the normal requirements per square meter of body surface per hour of time and for healthy adult males this has been found to be the equivalent of about 38 calories of heat; the abnormal variations above and below this standard are calculated and recorded in percentages of increase and decrease.

This subject was presented by the writer in its clinical aspects before the medical section of the American Medical Association in June, 1919; this being the first time that the subject had ever been presented before this organization in its clinical aspects. Since this time its clinical application has become little less than universal.

As thyroid secretion increases, metabolism goes up with it, increasing above the normal 25, 50 or 100 percent or even more. With insufficiency of thyroid secretion the oxidation processes gradually drop to 40 percent below the normal average, at which point, presumably without any thyroxim, they remain stationary, indicating that there are other factors which control the rate of oxidation below this level. It would be difficult to over-estimate the tremendous importance of such a variation of the fundamental chemical processes of life and for all practical purposes, with very minor exceptions, this is due entirely to the secretion of the thyroid gland. While other endocrin glands, for instance the suprarenals, have a slight influence upon metabolism, it may be safely assumed that these larger variations, in the absence of fever, indicate, with scarcely a single exception, thyroid pathology. This is one of the most important advances made in scientifically accurate diagnosis in the history of medicine.

It must not be supposed that this is the only function of the internal secretion of the thyroid gland. Indeed the consequences of moderate excess or deficiency carried out through long periods, or perhaps the life of the individual, leads to the most striking deviations from the normal architectural and other characteristics of the human body. We will look in vain, I think, for any more startling variations from the normal than those presented by the cretin on the one hand and certain types of hyperthyroidism on the other but aside from these extreme types there are many others which show

the profound influence of thyroid function in many ways. For instance, with somewhat subnormal thyroid secretion there is a tendency to retardation of bone growth with thick or even deformed bones, together with rather thick, rough, dry character of the skin, in fact the early phase of myxedema. With prolonged states of overfunction during the period of development the bone structures become delicate, with long, slender fingers, increased mobility of joints; thin, transparent, moist skin, with occasionally mottled erythema of neck and chest.

Among the important aspects of thyroid pathology may be mentioned its well-known function of combating infections by hyperplastic processes, undoubtedly associated with increased thyroid secretion. This is especially important in view of the relationship which is becoming more and more recognized of certain hitherto little understood types of low-grade sub-infection; most commonly perhaps water borne, though not essentially so.

It is difficult at present to reconcile the endemic incidence of goitre with an exclusive theory of infectious etiology. However, Dr. Wilson of Rochester, Minnesota, has apparently reached the general conclusion very definitely that the usual cause of goitre is a slow, chronic infection of this type, being in full agreement in this regard with McCarrison, Sajous, and others. In fact, I have said enough I think to show that the problems of thyroid pathology are among the most pressing and difficult of the entire field of preventive medicine.

A general study of the endemic foci of goitre seems to line up very plausibly with wide-spread infections. For instance the crowded population of Switzerland, with the intensified fertilization of the soil, offers very plausible opportunity for contamination of food products. On the other hand it would be difficult to explain the goitre zone of the Great Lakes region on this theory alone. A most remarkable phenomenon is the one reported by Hubner in which 16,000 individuals with goitre lost their goitres on immigration from Algiers to Prussia. An adequate study of differences in the sanitary conditions of these two countries might furnish the explanation.

In this connection I wish to refer briefly to the general etiology of the endocrinopathies and offer what seems to me the very plausible suggestion that the low grade infection theory might apply quite as well to the other endocrin glands. I would, however, make the important reservation that there are, without much doubt, other auxiliary or predisposing causes which may be sought for principally in the domains of heredity and environment.

It seems probable, if these infectious theories are substantiated, as they apparently are, that the time is not far distant when a large incidence of goitre will be as much of a sociologic disgrace as typhoid fever is now. The prevention of goitre should be our aim. In its early stages probably every case is amenable to medical treatment, and Sajous says that with early recognition and adequate treatment thyroidectomy will become a thing of the past. Whether or not this roseate prophecy will ever be fulfilled remains to be seen.

For the present the syndromes of cretinism and hyperthyroidism, with or without the other stigmata of Graves' disease, the nervousness, tremor, mild tachycardia, etc., are with us. Some of these syndromes may be directly due to infections without the aid of hyperthyroidism but with basal metabolism tests available we do not need longer to be in doubt on this problem.

I have said nothing of thyroid-therapy, nor can I take time to say more than that in the treatment of myxedema and allied conditions it offers one of the most brilliant chapters of organo-therapy. One cannot help wondering whether such interesting facts as the variation in the average weight of the thyroid, which varies so greatly in different countries and nationalities, may not be associated with sociologic and environmental conditions as yet illy understood, or not understood at all. For instance, the average weight of the thyroid in the United States is said to be 22 grammes; in Germany, 30 to 60; England, 30 to 40; France, 22 to 24. If the Germans have more thyroid than their Gaelic neighbors, it is quite worth while to ask the question, Why? And the answer may be indicated in the views just outlined.

I have already alluded to some of the remarkable property of the best-known, and indeed only known, hormone of the suprarenal gland and we will use this endocrin gland as a further illustration of the methods of procedure, experimentally and clinically, which have led up to the present state of our knowledge. This little gland, of such remarkable potentiality, weighs five grammes and one gland is placed upon the superior pole of each kidney. Its importance physiologically and clinically is very great. It furnishes at least one important hormone, epinephrin, which has already been referred to. At this point it might be well to call attention to the fact that any one active principal which has been isolated from any one gland may or may not be the only one. It is much more likely perhaps not to be the only one. In the case of the suprarenals we find an organ composed of two distinct parts or structures; a central portion or medulla and an outer layer of cortical substance. The medullary portion is composed of what is called chromafin tissue and it is this part of the gland alone which forms epinephrin. The entire structure of the medullary portion of the gland can be destroyed without fatal results while the destruction of the entire gland, or the cortical substance alone is always fatal. It

would not do to conclude from these facts that epinephrin is not essential in the animal economy because chromafin tissue which always secretes epinephrin is found in smaller collections elsewhere in the body. It has been estimated in fact that there is more chromafin tissue outside of the suprarenal medulla than inside of it. This proportion might vary in different animals and individuals and it is very probable that the destruction of the suprarenal gland would not include one-half of the total epinephrin producing tissue.

In spite of the fact that destruction of the cortical portion of the gland is uniformly fatal, no active hormone has been isolated from it, yet it is perfectly certain from the fatal results of its extirpation that some such extremely important biochemical body must exist.

In the earlier work upon the experimental extirpation of the suprarenal it was thought by some that the fatal results were due to the coincidental traumatism unavoidably produced in the operative procedure. This question was definitely settled by Biedls, who dissected the glands from their normal position, leaving them attached by pedicle of blood vessels, etc., and transplanted them in subcutaneous position. When they had fully recovered the glands were removed by a very simple operation with the usual fatal result.

There seems to be satisfactory evidence to prove that the medullary and cortical portions of these glands are really separate organs. The embryologic derivation of the suprarenal medulla is ectodermal, or the same as the derivation of the skin and nervous system, while the cortex has a meso blastic origin corresponding with the origin of the parenchymatous organs which confirms their anatomical physiologic independence, and some investigators think that the chromafin tissue of the medullary portion of the gland is accidentally included in the cortical portion by an enfolding process just as other collections of chromafin tissue might have been included. These facts are of more than speculative interest, showing in the first place the sharp limitations of our knowledge and proving the existence of important chemical bodies of which at present we know nothing.

The most conspicuous phenomenon in the partial or complete destruction of the suprarenal gland is weakness of the skeletal and cardiac muscles.

There are, of course, many other symptoms associated with this one. According to Cohoe* there are five different clinical syndromes produced by disturbance of the suprarenal gland:

1 (and most conspicuous) Addison's disease,
2 Hypo-adrenia,
3 Pseudo-hermaphodism,
4 Pubertas-precox,
5 Virilismus.

(*) **Endocrinology and Metabolism, Vol. 2, P. 277,** et seq.

It is obviously impossible to make even the briefest discussion of these syndromes. It has now been about three-quarters of a century since Addison's disease was first described and many points are still in controversy. Asthenia and pigmentation of the skin are the most striking characteristics. That it is related to the suprarenals is well established but just what part of the gland and what sort of pathology is essential are still matters of dispute. It seems certain that the cortex has more to do with it than the medulla.

In 70 percent of a considerable group of cases adrenal tuberculosis was present. In another considerable proportion simple atrophy existed. Next to the muscular weakness the pigmentation or melanoderma is the most consistent symptom but is not quite universal. It should be emphasized that patients may die of Addison's disease without the pigmentation. This is very liable to occur in the fulminant cases. I can recall several patients in my own clinical experience which I believe now may have been Addison's disease without pigmentation. Extreme and rapidly progressing weakness with very marked arterial hypotension with a systolic blood pressure sometimes reaching a point below 50 should create a strong suspicion of Addison's disease with absent or belated pigmentation.

If hypo-adrenia, which is very apt to be rapidly fatal, is to be recognized as a definite syndrome, the distinction between this and the early stages of Addison's disease without pigmentation would seem to be almost, if not altogether, clinically impossible.

The other suprarenal syndromes must be passed with mere mention. Those wishing to follow up the subject are referred to the excellent monographs of Cohoe, Quinby and Jump*.

The pituitary gland is essential to life; its removal being uniformly fatal. When removed from its bed in the turkish saddle one is astonished at its diminutive size. We place it on the scales and find that it weighs about 10 grains or 0.65 of a gramme.

The more one looks at this minute fragment of gland tissue the greater the astonishment becomes that it can possibly do what we know it does.

As with most of the endocrin glands the clinical phenomena may be divided into three groups, viz., hyper-function, hypo-function and disfunction.

The results of hyper-function vary according to whether they occur congenitally or later in life. If it is the former the active principles of the anterior lobe stimulate continuous overgrowth, more or less symmetrical in type, and gigantism results; if it occurs later as an acquired pathology the result is acromegaly. In this disease we note, as the most conspicuous

(*) **Endocrinology and Metabolism, Vol. 2.**

features, the peculiar deformities of bony growth—angular facies, enlargement of the mandible, enlarged hands and feet, etc. The individual is marked as the victim of a peculiar pathology. The results of deficient pituitary secretion are scarcely less conspicuous. The most notable is dystrophia adiposo genitalis, which is the equivalent in pituitary pathology of myxedema and cretinism in thyroid pathology. The typical cases are very characteristic and among the most obvious thing in these cases is the excessive obesity, largely distributed around the lower abdominal zone and hips. Closer examination reveals a more or less complete absence of pubic hair and infantile type of the genitalia. This syndrome is due to deficiency of the pituitary secretion.

Another syndrome is the well recognized type designated as dwarfism, which we know is also one of the results of early pituitary deficiency.

Still another is infantilism, characterized by arrested development, temporary or permanent in certain structures of the body. For instance, the persistent foramen ovale, cleft palate, extremely dwarfed stature, etc.

Still another type is the cachexia hypophysei privi with the very characteristic train of symptoms following the complete destruction of the pituitary gland. These symptoms are tremors, fibrillary twitchings, diminution in pulse and respiratory rate, fall in temperature, coma and death. These symptoms and the fatal result will not appear if a small functioning portion of the anterior lobe remains. They can also be prevented by the intra-cerebral transplantation of a small segment of the anterior lobe of a healthy pituitary gland, also by the subcutaneous injection of infusions of the same part of the gland.

Now these characteristic syndromes which I have briefly indicated, resulting from excess, deficiency or complete absence of the pituitary secretions, do not always exist in a pure, unmixed form. For instance, we may have a combination of gigantism with acromegaly, which I think might be explained by congenital hyperpituitarism, and later, perhaps, after an intermission of the hyper-pituitary state, or without an intermission, an acute exacerbation of the hyper-pituitarism, superadding the acromegalic syndrome to that of gigantism. Gigantism is probably always congenital and acromegaly always acquired.

It seems as though it should be possible with a thorough knowledge of the endocrin symptoms to recognize sometimes the early stages of acromegaly before the bony deformities have developed. There is clearly a period between the initial symptoms and the beginning of the characteristic deformities of acromegaly during which the permanent stigmata of the disease, if recognized, could be at least foretold and an opportunity given, if possible, to limit the duration of the hyper-pituitarism and possibly prevent the subsequent deformities. The diagnostic data of beginning acromegaly are first, severe persistent pituitary headache with lowered sugar tolerance, and tendency to glycosuria. These two symptoms should create a suspicion of beginning acromegaly which if the diagnosis is to be of practical value to the patient should be recognized before the secondary sexual characteristics, which develop a little later and which are the prelude to the bony deformities, have manifested themselves.

Again acromegaly has been found associated with exophthalmic goitre. Another group of cases presents the symptom complex, for instance, of either gigantism or acromegaly, together with the stigmata of infantilism. Such cases as these may well be called dispituitarism and offer excellent material for pathological speculation. For instance, has the syndrome of infantilism been stamped upon the individual by an early hypo-pituitarism and later the glandular activities becoming excessive and producing either gigantism or acromegaly, according to whether the change occurs congenitally or post-natally?

The whole subject of glandular disfunction is very perplexing and appears to me to rest upon one of two hypotheses:

First: The existence of one or more unidentified hormones, along with perhaps one that is fairly well understood and fully recognized, thus giving rise to various groupings of symptoms.

Second: An alternation of functional activity such as that above indicated by the co-existence of the syndrome of hypo and hyper-function; such conditions are actually indicated by what we now know of thyroid and pituitary pathology.

With regard to the active hormones of the pituitary gland we know very little about them. Only one definite chemical compound has been isolated, viz., tethilin, from the anterior lobe. It will be remembered that the complete removal of the anterior lobe is uniformly fatal and produces characteristic syndrome of cachexia hypophysei privi. On the other hand the posterior lobe apparently contains the active principles which have been classified as pressor, depressor and oxytocic. It has been conjectured that these unidentified hormones of the posterior lobe are derived by a splitting up process from the tethilin of the anterior lobe which is probably the particular hormone concerned when excessive in the production of the syndromes of overgrowth and when deficient of the syndromes of subnormal or arrested development.

Some of the most brilliant achievements of organo-therapy have been in cases for instance of the syndromes of hypo-function by intra-cerebral transplantation of the pituitary or subcutaneous injections of infusions of this gland.

In one of Cushing's cases subcutaneous injections were first used, producing great improvement which was later made permanent by the intra-cerebral transplantation of the pituitary gland of a newly-born, healthy infant accidentally dying at birth.

Time will not permit the discussion of the parathyroids with their syndrome of tetany and disturbances of calcium metabolism, etc.

Of the remaining eleven glands in the list of endocrin organs, the ovaries, the testes, the stomach and duodenum, the liver, the pancreas, the placenta and the mammary glands undoubtedly produce internal secretions of greater or less importance. An endocrin function of the pineal gland, the thymus and the prostate has not yet been satisfactorily established and space will not permit any discussion whatever.

Now what is the meaning of the entire subject of endocrinology to the general diagnostician and therapeutist? It is, I think, perfectly obvious that there is a large group of cases which can be differentiated only by utilizing all the facts concerning endocrinology and availing ourselves of the special diagnostic methods which have been developed within the last few years, and especially basal metabolism and carbohydrate tolerance. Many cases of endocrin disease have a perfectly normal basal metabolism. It is fully established that epinephrin causes definite but transient increase of basal metabolism. It bears no comparison with that produced by thyroxim and lasts only a very brief time. It is especially in alterations of the heart rate and certain types of nervousness in which the basal metabolism is almost decisive either for or against disturbances of thyroid as the probable causal factor. An increase or decrease in carbohydrate tolerance of a given case has an important bearing on the diagnostic questions. Frequently the presence or absence of one or two symptoms will point toward the existence of hyper-function on the one hand or hypo-function or disfunction on the other. It has frequently happened in my experience that the existence of endocrin disease and syphilis or tuberculosis as the principal factor in the causation of a given syndrome could be decided in this way.

After all what about therapeutics which is the goal of all clinical study? The value of these methods in differential diagnosis indicates the answer to this question in part.

Organo-therapy, which is commanding so much attention at the present, is far from being the only therapeutic deduction derived from a positive diagnosis of endocrin disease. In fact, I feel called upon to express a warning, if not a protest against the indiscriminate exploitation of organic products by commercial interests. A prominent writer along these lines, referring to the well-known facts concerning promiscuous use of these products, characterizes it as one of the worst forms of quackery and quotes the preposterous opinion that a number of endocrin products can be given and that nature will select the ones most needed. Such a total lack of the scientific spirit and careful consideration of all the facts is humiliating to say the least. In therapeutics, as well as in diagnosis, the endocrin glands have come to the front to stay but the number of these products that have a proven scientific basis is as yet very small and their use requires the most painstaking discrimination in order that the patient may not suffer from commercial vendors on the one hand and unscientific medical practice on the other.

THE NEUROLOGICAL PHASE OF ENDOCRINOLOGY*

C. C. BITLER, A. B., M. D.
NEWCASTLE

For practical purposes the human nervous system may be divided into three levels of activity, the vegetative, the sensorimotor and the psychic.

For a long time it has been asserted that the nervous system is the means by which all of the several parts of the human unit are integrated by a species of complicated adjustment to given ends. It can be perceived how this integration is actually brought to pass by means of the vegetative nervous system and the chemical regulators of metabolism at a physico-chemical level, and how by the successive compounding of reflexes at the sensorimotor level the human unit is further integrated, so that as a whole work more consistently toward broadly defined goals, the integration manifesting itself at successively higher and higher levels in the history of the individual and the species.

Viewed in this way the individual is seen struggling along the path of evolution in constant conflict between an inherent inertia that would keep it at a given level, but gradually advancing by a series of give and take compromises that finally bring it to a better adjustment with its environment at ever higher levels of integration.

This integrative action of the nervous system is illustrated in the simple reflex with its innervation of agonists on the one hand and antagonists on the other, and the channeling of final common pathways for nervous discharge.

This law of conflicting tendencies, pathways of opposites-ambivalence, where the final issue for higher integrations is made possible at the sensorimotor level by the tension of reciprocal innervations, is found also to be the rule in the vegetative nervous system, with its double set of pharmaco-dynamically demonstrated opposed elements, mediated at least in part by

(*) Second paper of symposium on Endocrinology presented before the Indiana State Medical Association at the Muncie session, September, 1922.

equally opposed, exciting and inhibiting chemical substances secreted by the endocrinous glands—the hormones.

Finally an analogous ambivalent mechanism is seen working at the highest, the most complex level, the psychic, which determines conduct with the assistance of the phenomena called consciousness, in which a psychological symbolism is found replacing sensory and motor neurons, and exciting and inhibiting hormones.

The biological activities which maintain life at the lowest level are physical and chemical, and thus that portion of the nervous system which has direct controlling influences over these activities is properly designated as the vegetative nervous system, and that part of neurology which has to do with a consideration of these physico-chemical systems, because it deals with the nervous control of the viscera and of metabolism, is properly designated as visceral or vegetative neurology.

In this region of vegetative neurology a rich variety of disturbances is found, involving the glandular, gastro-intestinal, genito-urinary, vascular, respiratory, muscular, cutaneous, and bony systems. In addition, there are certain complex groups involving, for the most part, the glands of internal secretion, the endocrinopathies.

From the foregoing we see how the three levels of the nervous system are interdependent one upon the other. Inasmuch as the physico-chemical substances secreted by the endocrine glands have their direct action upon the vegetative nervous system and, vice versa, the influence of the vegetative nervous system upon the glands of internal secretion, we will consider this relationship more minutely and endeavor to show the effect upon the other levels, and the individual's various physiological, neurological and psychological reactions.

Stimulation of the glands of internal secretion takes place through the vegetative nerves, and the hormones produced by the glands in turn stimulate vegetative nerve structures. Thus, the sympathetic nervous system, the endocrine glands and the gonads form a basic tripod, entrusted with the duty both of the preservation of the individual and the continuity of the species. Their relationship is shown in disease as well as in health, and is reflected in many of the neuroses and psychoses.

The importance of these two subjects can be appreciated fully only when the fact is grasped that every normal action expressed in the unstriated musculature of the body, the heart, and the secreting glands, must be brought about in response to stimulation by the chemical substances secreted by the glands of internal secretion or by the vegetative nerves. There cannot be a single sensory or psychical impression which does not, at least theoretically, affect the vegetative nerves and endocrine glands. Further, if the impressions are strong, they upset the equilibrium in the endocrine and vegetative systems and produce symptoms of disease. Many symptoms which manifest themselves in the so-called vegetative structures (smooth musculature, heart, and secreting glands) are due to disturbances in the normal physiologic equilibrium of these two systems.

Not only are both the endocrine and vegetative systems subject to impulses of a physical nature, but each system is influenced by psychical impulses and by impulses which originate in the other system. It is now our purpose to inquire into this relationship and show, as far as we are able, how the vegetative nerves influence the endocrine glands and how the chemical substances produced by these glands influence the visceral nerves.

The autonomic or vegetative nervous system consists of two divisions, the sympathetic and parasympathetic. The sympathetic division is sometimes called the thoracicolumbar outflow, because it takes its origin in the cord from the thoracic and upper four lumbar segments. The parasympathetic division, on the other hand, is called the craniosacral outflow, because the nerves composing it arise from the brain and the sacral portion of the spinal cord. The parasympathetic division is also sometimes called the "autonomic" or "vagus system" since the vagus nerve is the chief one of that system. Certain of the body structures are innervated wholly by one division of the autonomic system and others by the other; again, structures are activated by one division and inhibited by the other. There are certain centers in the brain for the regulation of many important functions presided over by the vegetative system. These centers may be looked upon as being receiving and dispatching stations, through which integration of action is maintained. There is a sympathetic center in the brain which Karplus and Kriedl have described as lying near the tuber cinereum. It is significant that these sympathetic centers lie in the same area as those which control such functions as thermogenesis, polyuria, and vasomotor changes.

Stimuli which act upon the sympathetic system may either act on the sympathetic centers in the brain and cord, or on the true sympathetic motor cells in the peripheral ganglia. Some evidence has been published by Camus and Roussey which would indicate that the polyuria depending on hypophyseal disease might be due to local irritation of these centers, as will be mentioned later.

The pilomotor muscles, the sweat glands, the blood vessels, fallopian tubes, body of the uterus, vas deferens, seminal vesicles, and ureter, also the suprarenal and thyroid glands and the anterior lobe of the pituitary body are wholly, or almost wholly, supplied by fibers from the

sympathetic system, both activation and inhibition of action being accomplished through neurons belonging to the same system.

There are certain structures which are believed to be supplied by the parasympathetics, such as the ciliary muscle, esophagus, and cardiac end of the stomach.

The following structures are activated by the parasympathetics and inhibited by the sympathetics:

1. The gastro-intestinal tract, both musculature and secreting glands, excepting the esophagus, cardiac end of the stomach, and sphincters.

2. Those structures derived embryologically from the gastro-intestinal tract, both musculature and secreting glands, such as: (a) the respiratory tract, (b) liver and gall bladder, (c) pancreas, (d) the body of the bladder and the muscles around the prostate gland.

3. Certain structures about the head: (a) the pupillary muscle, (b) the lacrimal glands, (c) salivary glands, (d) the gland and smooth musculature of the nose, sinuses, mouth and pharynx.

The following structures are activated by the sympathetics and inhibited by the parasympathetics: (1) The sphincters of the gut and bladder, (2) the trigone of the bladder, (3) the urethra.

The necessity for students of endocrinology being familiar with the vegetative nerves and the action of each division upon the various tissues is evident from the fact that some internal secretions act upon one division, others upon the other, and some apparently upon both; and since many of the symptoms which result from altered secretions of the endocrine glands depend upon the manner in which they affect the vegetative nerves, it is absolutely essential for clinicians to bear in mind that symptoms on the part of the vegetative structures must necessarily differ according to the sensitiveness of the various nerve cells to stimuli.

The medical profession is indebted to Eppinger and Hess for a valuable contribution to clinical vegetative neurology in their conception of "vagotonia" and "sympathicotonia". These clinicians have shown that by the physiologic difference in action of the sympathetic and parasympathetic neurons of the vegetative system there may be recognized two definite clinical groups, "sympathicotonic" and "vagotonic," which are met constantly in practice. In certain groups of men symptoms of predominant sympathetic stimulation exist, and in others predominant parasympathetic stimulations. These different characteristics depend upon the fact that the two divisions of the vegetative systems are antagonistic in action in structures which are supplied by both, and further, that each supplies certain structures alone. If the sympathetic nerve cells are hyperirritable, sympathetic action predominates in the individual; if the parasympathetic nerve cells are hyperirritable, parasympathetic action predominates. Those patients belonging to the former group are called "sympathicotonic", those to the latter, "vagotonic".

Sympathetic hyperirritability (sympathicotonia) is manifested in some of the following symptoms: Dilation of the pupil; protrusion of the eyeball; lessened lacrimal secretion; lessened salivary secretion; lessened mucous secretion in the nose and throat; lessened secretion in the gastro-intestinal tract, showing particularly as hypochloryhydria and retarded digestion; lessened motility in the gastro-intestinal tract, showing a slowness in emptying the stomach, contraction of sphincters of the gut, and a general relaxation of the intestinal musculature leading to the common type of constipation found in the acute infectious diseases; rapid pulse and at times rise of blood pressure, although vasoconstriction in one area is usually accompanied by compensatory vasodilation in others; increase in body temperature due to vasoconstriction in the superficial vessels which interferes with the elimination of heat; and an increased production of heat resulting from the increased metabolic action; diminution in the amount of urine; alimentary glycosuria; contraction of the ureter; contraction of the uterus; goose flesh; and increased sweating. Increased suprarenal, thyroid, and pituitary secretion also follow sympathetic stimulation; and this in turn produces symptoms varying in degree according to the amount of extra secretion formed.

Parasympathetic hyperirritability (vagotonia) is accompanied by some of the following: Contraction of the pupil; widening of the eye slits; increased lacrimation; increased secretion of nasal, oral, and pharyngeal mucous glands, conditions commonly known as catarrh; increased salivary secretion; contraction of the laryngeal muscles, such as is met in laryngospasm; increased bronchial secretion, such as is met in bronchitis; spasm of the bronchial musculature, as found in asthma; hypermotility and hypersecretion of the gastric glands, including that of hydrochloric acid; hypersecretion and hypermotility of the intestine, leading to colicky pains and state of either spastic constipation and stasis or diarrhea, depending much on the degree of stimulation and on whether the circular or longitudinal muscles are predominantly the recipients of the increased stimulation; irritable bladder; and incontinence of urine and feces. Sweating is also found in conditions which are accompanied by the above group of symptoms, as well as those belonging to the sympathetic syndrome.

It must be evident to the most casual observer that the action of a given stimulus would differ, according to the irritability of the nerve cells acted upon; but when we consider that internal

secretions are more or less selective in their action, affecting one division of the vegetative system at times to the exclusion of the other, it is further evident that the resultant action would differ greatly, according to whether the patient is a sympathicotonic or a vagotonic. With this conception grasped, one very important fact in explaining the variability of symptoms in the same disease in different individuals is established. Hyperirritability may be general or confined to certain structures. Symptoms will often be confined to certain structures, because the nerve cells in these structures are discharged only to a significant extent. If the exciting stimulus were stronger, the symptoms would be more widespread, involving other neurons.

There is an intimate relationship between the glands of internal secretion and the vegetative nerves. Stimulation of the sympathetic nerves, as before mentioned, increases the secretion from some of these glands, particularly the medulla of the suprarenals, the thyroid, and possibly the pituitary. Stimulation of the parasympathetics activates others. There is evidence also that the secretion from the various endocrine glands, on the other hand, activates the vegetative nervous system, some secretions, like that from the suprarenals, hypophysis, and thyroid, acting upon the sympathetics, and others such as that of the parathyroid, ovary and pancreas, acting upon the parasympathetics. The intimate relationship between the autonomic system and the endocrine organs has been especially emphasized by the Italian School. Pende (1916) has developed at length the conception of such relationship. Indeed, so close does he regard the functional connection that he consistently treats of the two as constituting for practical purposes a single mechanism. It is assumed, says vonFurth, that the suprarenals, thyroid, and hypophysis, activated by the sympathetics, have an accelerating influence upon metabolism, stimulating protein destruction, carbohydrate mobilization, and likewise the metabolism of fats, while they also control the water and salt output and the galvanic irritability of nerves.

The importance of these facts is evident to the clinician who appreciates them, and affords a basis for understanding the nervous manifestations found in endocrine disorders and endocrine manifestations found in nervous disorders. One cannot conceive of any marked change taking place in the secretion of any of the important endocrine glands, either a withdrawal, as occurs in the conditions of hypofunction, or an addition, as occurs in conditions of hyperfunction, without affecting or destroying the equilibrium of the vegetative nervous system, neither can one conceive of any marked stimulation occurring in either of the divisions of the vegetative system, without affecting some of the endocrine glands. In disturbance in the vegetative nerves, the symptoms are often expressive of a stimulation of one division only, although at times there may be symptoms belonging to both divisions. Endocrine disturbances are almost always pluriglandular. With this introduction, it can be seen that the action of the vegetative nerves and the secretions of the endocrine glands are so intimately related and correlated that they cannot be separated. Both are avenues through which action in different structures is correlated and integrated; and each in turn stimulates and receives stimulation from the other.

With the foregoing facts and theories in mind, we will endeavor to show the relations between some of the more important individual endocrine glands and the vegetative nervous system as well as the sensorimotor and psychic levels.

The secretion of the medulla of the suprarenal gland, in its relationship to the vegetative nerves, is better understood than that of any other internal secretion. This understanding has been facilitated by the determination of the close relationship which exists between the chromaphil tissue in the medulla of the suprarenal body and the cells of the sympathetic division of the vegetative nervous system, as shown by Balfour, Kohn, and Gaskell. The chromaffin cells found in the medulla of the suprarenal gland are differentiated sympathetic cells, having been derived from that portion of the central nervous system which migrated from the neural canal to form the sympathetic system. They are influenced by the same stimuli that act upon the sympathetic nerves (Elliott, 1912) and epinephrin, the resulting secretion, influences all tissues, except the sweat glands, that are acted upon by the sympathetics, and produces the same effect as though the sympathetic nerves themselves were stimulated. This fact was finally brilliantly demonstrated by Elliott in 1905, although foreshadowed by the results of several other investigators.

The action of epinephrin, as generally admitted, except in the case of the blood vessels, is not on the central nerve cells, but in the organ or structure itself at the myoneural junction (Elliott, 1905). That the action is not directly upon the cells is inferred according to Macleod from the fact that epinephrin is "incapable of acting on tissues which are devoid of sympathetic nerve fibers, and is also inactive on those tissues in the embryo which have not yet received any nerve supply." Recent experiments by Hartman (1917), however, show that the action of epinephrin in the control of the blood vessels of the body may be exerted either in the dorsal root or sympathetic ganglia, as will be discussed later.

Biedl and Dreyer have shown that stimulation of the sympathetic fibers to the suprarenal

glands causes an augmented secretion of epinephrin. From this fact the inference follows that any condition leading to generalized discharge through the sympathetic system leads to a similar effect. Several investigators, and especially Cannon and his co-workers, have adduced positive evidence that the emotions, pain, and asphyxia, all of which lead to generalized sympathetic discharge, cause an enhanced discharge of epinephrin. Stewart maintains, however, that none of the evidence so far offered is adequate to determine the matter. It is by such "after discharge" of epinephrin that Cannon explains the prolonged bodily reaction to emotions after all superficial evidence of the operation of the exciting cause has disappeared. Dr. Pottenger has called attention (1916, 1918)) to the fact that an anaylsis of the syndrome of toxemia, as expressed in the peripheral tissues, shows its manifestations to be a result of general sympathetic stimulation. We are justified in assuming, therefore, that toxemia stimulates the suprarenals and causes them to produce an increased amount of secretion, which augments and prolongs the effect of the nerve stimulus; and, further, that severe or chronic infections may stimulate and exhaust the suprarenals. The question of inhibition of action in the suprarenal gland is one that has interested physiologists and clinicians for a long time. Hertofore nothing definite has been known, but Cannon (1920) as a result of recent investigation, states that stimulation of the afferent vagus fibers causes inhibition of the suprarenal medulla: while stimulation of the sensory somatic fibers results in increased suprarenal secretion. This is a very important contribution.

Loss of the suprarenal medulla induces no symptoms and no disease, according to the most reliable observations. However, loss of the suprarenal cortex causes profound prostration and death within a few days, in what appears to be acute Addison's disease. Grief, fright, or other forms of sudden emotion will produce glycosuria, due to the sympathetic effect upon the suprarenal glands. Also apoplectiform attacks resembling a cerebral hemorrhage have been reported when autopsy showed suprarenal hemorrhage. Addison's disease is characterized by slow degeneration of the suprarenal gland as a whole. The neurological symptoms are chiefly gradually developing asthenia with arterial hypotension, amyatrophy, depression, unwillingness to do anything, with occurence of myoclonic and epileptiform convulsions, with periodic palsies, confusional states, delirium, chronic paranoid ideas, coma, death.

Hyperactivity of the adrenal glands is very rare, usually occurring in women, but may occur in men. The more common neurological symptoms are overactivity, nervous agitation, and even approaching maniac episodes. These patients are usually precocious, but again they may be imbeciles.

The thyroid gland is innervated by the cervical sympathetic, also by the autonomic. But there is evidence to show that the secretory reflexes pass by means of the sympathetic fibers and not by the cranial autonomic ones (Cannon and Cattell) (*Am. Jour. Physiol.*, 1916). The chief endocrinopathies produced by thyroid disease are those due to lessened function, and those due to an excess of function.

Hypothyroidism is due to a variety of conditions, namely: developmental defects, vascular changes, degenerative processes of the gland tissues itself and new growth, also acute infections, psychic states such as grief, anxiety and mental strain.

In hypothyroidism the central nervous system suffers severely. The brain may show defective convolution and all parts of the central, peripheral and autonomic nervous systems exhibit the signs of retarded and deficient development. Aside from the anatomical changes in the bony development which is partly due to lessened function of the pituitary, the chief mental and neurological symptoms are in certain cases imbecility, in others dullness and apathy, the child may not be able to talk until the third or fourth year, irritability, the cranial nerves may show defective development, the cerebrospinal nerves may be deficient, the motility as well as the sensibility is diminished both as a result of peripheral and central maldevelopment.

The reflexes are not markedly changed. The gait is usually wide based and clumsy and due in part to the mental dullness. There is usually defect of memory, attention is diminished, thinking goes on more slowly, but may be of fair capacity. There is usually a loss of initiative, and emotional dullness goes along with the sensory losses and motor reluctance. The speech is apt to be slow, as are other motor acts. It is monotonous and the thickened lips further contribute to make it at times unintelligible. The whole appearance of the patient is one of gradually advancing stupidity which, if there is no relief, goes on to more profound defect states as dementia. Hearing is usually defective. According to some investigators, there is a certain amount of degeneration found in the vagus and glossopharyngeal nuclei.

We may have varying grades of hyperthyroidism, ranging all the way from apparently the normal state to the extreme type, known as exophthalmic goitre. The gland is usually enlarged and elastic, the vessels dilated and new proliferating blood vessels are found. However we may have cases of hyperfunctioning without apparent anatomical changes. We also have hyperthyroid conditions following the acute infectious diseases and acute toxic states, such as iodine poisoning. Fear, anxiety, disappointment or any other mental stress and strain are causative factors in producing hyperthyroidism as was demonstrated during the recent World War when we had an enormous amount of cases

of hyperthyroidism developed among our soldiers, thus showing the close relationship between the psychic, vegetative nervous systems, and the endocrine glands. In exophthalmic goiter we see the close relationship of the thyroid glands with the vegetative nervous system and many of the symptoms are readily seen if we have a correct understanding of our neurology. For instance, the sympathetic irritation explains the exophthalmos, tachycardia, loss of weight, and the alimentary glycosuria. Autonomic irritability causes the von Graefe, the lymphocytosis, the diarrhea, the increased secretions. The influence of the thyroids on the carbohydrate metabolism, as seen in the rapid emaciation and alimentary glycosuria, possibly acts through the pancreatic retardation or through a relative increase in adrenalin action. That the thymus is involved in the blood picture formation seems certain.

Thus one comes to a combined neurochemical theory in that exophthalmic goiter is dependent upon hyperactivity of the thyroid secretions, which increased secretions act through the visceral or vegetative nervous system. Both autonomic and sympathetic systems are thus in a state of hyperexcitability—a condition the anatomical foundations for which are found in a type of individual termed vagotonic by Eppinger.

The neurological symptoms are chiefly vegetative as seen in tachycardia, von Graefe sign, swollen eye lids, protrusion of the eye balls, retracted lids, Lowi's sign (dilation from adrenalin), irregular or stiff pupils, also loss of the accommodation reflexes. Optic nerve atrophy occasionally increased tear secretion early, with dry eyes later, also inefficiency of convergence without double vision (Möbius' sign). Usually the skin is moist, with excessive perspiration in spots is occasionally found. Vasomotor instability is frequent. Marked reddening alternates with paleness. The surface heat is usually increased. Dermographia and urticaria and goose flesh are often found, also the nails show deformities. Tremor is almost constant in varying degrees, psychical stimuli usually increases the tremor. There is a general psychomotor and emotional irritability. Moodiness and sudden changes are frequent. In marked cases distinctly manic phases may develop: again acute and deep depressions (often suicidal) take their place. Thus the picture approaches very closely at times to the type of Kraepelin's mixed manic-depressives, or the more typical circular forms of this psychosis. Toxic epiphenomena may take place with ideas of reference, or persecution, even hallucinations, principally of sight. The general picture of an acute delirium is a grave sign.

The nerve supply to the parathyroid is from the parivascular sympathetic plexus, the fibers ending on and between the gland cells. Contrary to the rich nerve supply to the thyroid, the supply to the parathyroids is very scanty.

The relation between the thyroid gland and the parathyroids is doubtful, though some authors claim that after extirpation of the thyroid gland, the parathyroids hypertrophy, but this cannot be substantiated.

As a result of degeneration or removal of the parathyroid gland, a condition known as tetany results. Tetany is a clinical syndrome characterized by a peculiar hyperexcitability of the nervous system (motor, sensory and autonomic), and in manifest cases, also by spontaneous attacks of peculiar tonic spasms, involving certain groups of muscles, or even the whole body musculature. Tetany has as its main symptoms tonic, intermittent, bilateral, often painful cramps, which without, for the most part, any loss of consciousness, involve the muscles of the upper extremities, particularly the hand, which is held in the obstetrical position. The muscles of the lower extremities may be involved also, those of the larynx, of the face, and of the jaw, seldom those of the chest, abdomen, neck, diaphragm, or tongue. In rarer cases the eyeball muscles are implicated, as is also the bladder. In the sensory sphere paresthesiæ and pains are present, while hyperesthesiæ occur now and then. Pressure upon the brachial plexus may give rise to an attack: hyperexcitability to electrical currents is present (Erb), mechanical hyperexcitability of the muscles and motor nerves is observed (Chvostek), while the sensory hyperactivity to mechanical and electrical stimuli is also present (Hoffmann). The psyche is rarely uninvolved, and following operative removal there has developed extreme anxiety with the sense of impending dissolution. The hyperexcitability of the neuromuscular apparatus is primarily due to a change (chiefly a deficiency) in the amount of the calcium in the blood, which is probably the one great function of the parathyroids.

The hypophysis is a most interesting organ, from an anatomical, phylogenetic and physiological standpoint. It is divided into three main parts, the pars anterior, usually referred to as the pituitary, and is derived from the gastro-enteron, and is epithelial in structure; and the pars intermedia, which is probably derived from the anterior portion and the posterior part, pars nervosa, or infindibulum, which is made up from neurogliar cells. The pars intermedia contributes its secretion to the cerebro-spinal fluid. There may be numerous accessory pituitary structures which have physiological significance, but this has never been determined. The whole gland is innervated by cervical sympathetic nerve fibers. Numerous disease syndromes are possible from diseases of the hypophysis, but the two best known from an endocrine standpoint are concerned with the anterior lobe, the

pituitary. These may be grouped under hyperpituitarism and hypopituitarism.

Acromegaly is characterized by the gradual enlargement of the bones of the nose, jaw, hands and feet and a hyperplasia of all of the bony structures due to an overactivity of the vegetative nervous system. This overexcitability of the nervous regulators of metabolism, from excessive pituitrin secretion, also induces hyperplasia of other endocrious structures, notably the thyroids, interstitial gonadel cells and the suprarenal cortex. From these contributory factors arise a medley (often contradictory) of thyroid, genital and vascular anomalies, some in the nature of hyperplasia, some of a degenerative or inhibitive character such as hairy and genital defects. The change in the pituitary itself is most frequently of an adenomatous or adenosarcomatous type, although this is not invariable. In pure adenomata of the pituitary the symptoms tend to be more clean-cut and classical. As a rule the whole hypophysis is implicated, which brings the posterior lobe (infundibulin) into increased or diminished activity with contradictory and mixed syndromes.

The neurological symptoms found in hyperpituitarism are most variable, due to the close connection between the activities of the pituitary gland and the other glands of internal secretion, also pressure symptoms due to the enlargement of the hypophysis. Amenorrhea is frequent in women and loss of potency in men, usually associated with atrophy of the gonads. The muscular tissues have a tendency to atrophy early in the disorder following hypertrophy.

Anomalies dependent upon thyroid alterations are frequent. These consist, for the most part, of increased sweating, tachycardia, diarrheas, exophthalmos at times, Stelwag's symptoms, irregular palperbral fissures, variations in pupillary equality, tremor, thermal alterations is apparently related to the arteriosclerosis frequently seen, diabetes mellitus or glycosuria, and other signs of altered adrenalin activity. In addition to the essential metabolic disturbances, symptoms due to the nature of the producing lesions tumor, hyperplasia, neighborhood symptoms, are frequently found, but these are not invariable. Severe bitemporal headaches are frequent. This is an intracranial pressure sign. The sella turcica is usually enlarged from tumor formation, as disclosed by the x-ray examination. Pressure upon the optic nerves at the chiams is usual, leading to various types of hemianopsia or even blindness. Distorted fields are the rule. Mental symptoms ranging from sluggishness to severe deterioration occur, but are not invariable. Epileptic attacks may occur, which may be due to intracranial pressure and not necessarily due to any abnormal secretion. Overactivity of the pituitary gland usually leads to overactivity of the other endocrine glands, and, vice versa, feeding of extracts of the other endocrine glands, usually leads to a hyperplasia of the pituitary gland.

Hypopituitarism with its varying grades also produces a very interesting train of symptoms and syndromes. Removal of the whole gland is uniformly fatal, producing symptoms of tremor, muscular fibrillation, diminution of pulse and respiratory rate, subnormal temperature, stupor and coma (cachexia hyperphysopriva acuta). Removal of the posterior lobe does not cause death or any special symptoms. Complete removal of the anterior lobe results in death to the animals. Separation of the stalk causes death. Partial removal of the anterior lobe causes obesity. Cushing and his collaborators made the additional observation that the obesity was of the character found in the condition described as dystrophia adiposogenitalis since it was associated with genital atrophy; and they further observed that in young animals persistent infantilism occurred after partial removal of the anterior lobe. The same observers also noted that the subnormal temperature, which is a symptom in dystrophia adiposogenitalis, could be raised by an injection of an extract made from the pars anterior. This phenomenon they referred to as the "thermic reaction". The increased carbohydrate tolerance, studied by Goetsch, Cushing and Jackson, and the low blood pressure, symptoms of posterior lobe deficiency, they were able to relieve by injection of infundibulum. W. Blair Bell in some recent animal experimentation, was unable to produce the syndrome of dystrophia adiposogenitalis by the partial removal of the pars anterior, although it followed compression and separation of the stalk; however, in both instances the genital syndrome developed.

Manifestations of psychic disturbances may result from increased intracranial pressure, especially from a growth involving the temporal and frontal lobes, and form insufficient glandular secretion. Some of the former have been enumerated under neighborhood symptoms, but in addition, states of excitement, depression, psychoneurosis, and even hallucinations may develop. Lassitude, torpidity, and drowsiness are among the earliest symptoms. Lesions involving the frontal lobes gives rise to such symptoms as impairment of memory, disorientation, untidiness, apathy, and stupor. Children suffering with hypopituitarism are usually temperamentally dull and apathetic, and are backward in their studies. They are usually irritable and often have difficulties with their playmates because of their lack of self-reliance and self-control. As a result of insufficiency of the pituitary gland mental symptoms frequently develop which vary from a mild psychosis to advanced forms of epilepsy and insanity. Beverly Tucker ascribes to the pituitary certain psychoses of

adolescence some of which he attributes to hyperpituitarism, others to hypopituitarism. The latter he divides into two groups. The commonest psychosis resembles dementia præcox. The preadolescent symptoms are negligible. The patients begin to be dull in their studies, seclusive, and self-absorbed. Repetition of movements is common; hallucinations and delusions may or may not be present. They have difficulty in expressing themselves in writing, and are usually unemotional and unaffectionate, and obstinate and irritable when disturbed. There is thickening and enlargement of the clinoid processes but the sella is about normal in size. To another group belong those cases in which the psychosis is not very profound. It consists chiefly of irritability, mental dullness, tardiness, truancy, and general lack of ambition, and in some cases epileptiform seizures. Roentgenograms show a small crowded fossa. A special form of hypophyseal psychosis has been described with confusional states and narcolepsy as the chief symptom (Tom Williams). Other psychic manifestations are lack of emotional inhibition, highly excitable states alternating with sluggishness, frequently phobias and compulsions, and moral and sexual obliquities, characteristics modified by pituitary feeding (Timme). The narcoleptic attacks are not attributed to a secretory disturbance of the pituitary gland. They are a part of a syndrome in which symptoms of cardiovascular irregularities occur; namely, tachycardia, arrhythmia, extrasystoles, embryocardia, and hypertension in addition to polyuria and polydipsia; according to the experimental observations of Ashmer J. Camus and G. Roussy the entire syndrome can be produced by excitation of the tuber cinereum and infundibulum. This view is supported clinically by a case in which at autopsy the hypophysis was normal, but a tumor of the third ventricle was found.

It has also been shown experimentally that if the whole gland or a very large portion of it be removed, profound somnolence is apt to develop. This is associated with a subnormal temperature, slowing of the pulse and respiration, and diminished sensitiveness to pain, symptoms which frequently improve on the administration of pituitary gland substance. Somnolence has a tendency to occur periodically, sometimes daily aside from the habitual sleeping hours, and then again with days intervening during which they respond fairly normal, and the sensorium is reasonably clear. It is this condition which suggested the possible relationship between the function of the hypophysis and hibernation in animals as first pointed out by Gemilli (1906) and later emphasized by Cushing. Persistent yawning, which often accompanies drowsiness, is a characteristic feature. The entire syndrome of somnolence, yawning, dullness, apathy, etc., with the presence of a clear sensorium shows a striking analogy to that of encephalitic lethargica. The fluctuating character of the former and the mode of onset are the chief differentiating features. Attention has been called by Cushing to the relation of epileptiform seizures to lesions producing hypopituitarism. The so-called uncinate attacks are caused by a lesion extending into the interpeduncular region, producing pressure on or irritation of the uncinate gyrus. The aura is characterized by hallucinations of taste and smell. Sometimes the gustatory and olfactory phenomena with temporary loss of memory constitute the attack; at other times the attacks are more complete with marked convulsive seizures. General epileptiform seizures, which occur without uncinate factors, are probably due to glandular insufficiency, the result of hypoplasia. On the relation of epilepsy to pituitary disorders the following is quoted from Cushing: "One may reassemble the data in regard to the possible relation of hypophyseal insufficiency to epilepsy as follows:

"1. Horsley, it will be recalled, in his first experimental hypophysectomies in the canine observed no post-operative changes whatsoever in the condition of the animals. They were, however, used subsequently as subjects of cortical stimulation, and he noted that the motor cortex was unusually excitable.

"2. As already stated, we have observed a tendency to epileptiform convulsions in a number of our animals kept for long periods after partial hypophysectomy—animals that ultimately exhibited symptoms which we attribute to glandular insufficiency.

"3. The study of a series of cases of hypophyseal disease in man has shown that epilepsy —a symptom unobserved in states of hyperpituitarism—is a frequent accompaniment of clinical conditions in which an insufficiency of the gland is manifest. Moreover, that the brain, under these circumstances, is possibly overexcitable is suggested by the number of individuals in whom gustatory attacks have occurred under the influence presumably of a direct local irritation of the adjacent uncinate cortex by the enlarged gland.

"4. As is well known, epilepsy is a frequent sequel of cranial injuries. In certain types of injury, as the common bursting fractures of the base, the pituitary body is prone to be damaged.

"5. If, as we believe to be the case, the posterior lobe secretion normally enters the cerebrospinal fluid and thus comes to be in solution in a fluid which subsequently bathes the cortex, it is possible that its diminution from hypophyseal disease or injury may unfavorably affect the activity of the cortical cells. On this basis it is conceivable that a local scar which involves, or a tumor which presses upon, a given area of the cortex, may prevent the access to the cells of a substance which is essential to their functional stability.

"6. Many individuals, supposed to be suffering from so-called genuine or essential epilepsy, present manifestations of a nutritional disorder —a tendency to adiposity and a high sugar tolerance, coupled with a lowered temperature and pulse rate, closely akin to the constitutional state which characterizes hypophyseal deficiency. In some of these individuals the administration of hypophyseal extract has served to moderate the seizures from which they previously suffered."

Johnston, basing his opinion on the x-ray findings of the sella turcica, states that the factor chiefly concerned in a certain group of cases of epilepsy is a mechanical one. The small roofed sella which encroaches upon the gland interferes with the normal blood supply and psysiological activity, in consequence of which the animal economy is deprived of those substances produced within the pituitary, necessary to stimulate normal metabolism. He substantiates his view by the fact that these cases are benefited by pituitary feeding, and suggests that relief might follow the resection of the clinoid processes; in other words, by a sellar decompression. Numerous other researches have been made along this line, the results of which are too vague and indefinite to enumerate.

The secretion from the posterior lobe of the hypophysis is poured into the cerebrospinal fluid, though some investigators contend that part of it is poured into the blood stream directly. At any rate, the effects of the secretion of the posterior lobe are undoubtedly pressor, producing vaso constriction, peristalsis, also contraction of other smooth muscle as the uterus and bladder. This action is most probably due to a stimulation of the sympathetic nerve endings in the smooth muscle.

The most outstanding symptoms of posterior lobe deficiency are hypotension, increased sugar tolerance, diminution of basal metabolism, and asthenia.

The gonads are composed of two types of cells, those cells having to do with reproduction, the gamete cells in the male and the Graafian follicle in the female, and those interstitial cells of Leydig which produce a definite internal secretion. This interstitial hormone acts as a connecting link between the soma and the gonads and through this specific action, particularly marked in the male, exercises a direct and specific stimulus upon the somatic structure of the body, thus increasing growth activity, causing definite lines of development, varying in sexes, and so affecting the whole muscle and nerve metabolism as to produce profound and far-reaching alterations. It is extremely difficult in the present state of our knowledge to discuss, in an intelligent manner, the relationship between the sex glands and the vegetative system. Both ovaries and testicles are innervated by sympathetic nerves, and the secretion from the testicles, according to Wheelon, is sympathicotropic, while that from the ovary seems to be different, as shown by Hoskins and Wheelon. Castration of males caused a lowered irritability of the sympathetic system, whereas spaying of the females caused a heightened irritability of the same system. Wheelon and Shipley estimated that castration of males lowered sympathetic irritability by fifty percent. The internal secretion of the ovary, or at least that of the corpus luteum, is also sympathicotropic, if we may judge from the clinical symptoms which appear preceding the menstrual flow and those at the beginning of pregnancy or after cophorectomy, when the menstrual cycle suddenly ceases, or at the climacteric, when the secretion is gradually withdrawn. During the latter half of the menstrual cycle the secretion from the ovary exerts a marked nervous and psychical influence upon the patient. This influence, as expressed through the vegetative nervous system, seems to be preponderantly that of sympathetic stimulation. The pulse usually increases in rapidity, the blood pressure becomes higher, the temperature is elevated, and a slight neutrophylic hyperleukocytosis is noted. While these symptoms may be evidence of increased sympathetic stimulation, we cannot claim that they are wholly due to direct stimulation of the sympathetic nerves, because this physiologic process makes an impression upon other organs of internal secretion, such as the thyroid, pituitary, and suprarenals, and upon the nervous system as a whole, and probably, most of all, upon the psychical centers. Immediately following the commencement of the flow, a general relaxation of tension takes place. Nervous and psychical irritability disappear, the pulse becomes less frequent, the temperature drops, and blood pressure falls.

The gonad syndromes are so interlinked with those of the other endocrine glands, especially suprarenal cortex, the pituitary and the thyroid, that it is difficult to single out any set of symptoms and ascribe them to gonadal dyscrasias. The symptoms vary considerably, depending upon the age of the individual when the (usually surgical) loss of the gonads takes place. In early loss in the male (castration before puberty, destructive orchitides) the penis, prostate and seminal vesicles remain small, erotic desire fails to show itself, and potency is lost. In the female a similar failure of development takes place. The girl is apt to grow tall, boyish in type, with infantile secondary characters. Later loss, after puberty, tends to increase the size of the skeleton—a tall, thin, type and short, fat, dumpy type with broad hips, female fat distribution on the breasts, buttocks and iliac crests. The lower extremities develop disproportionately more than the upper, or vice versa. The head is flattened behind, the sella turcica widened, the superciliary ridge is apt to be prominent. The skin is usually smooth, cool, marble-like, poor in pigment and color; the hair

of the head usually thick while that of the face is absent or only downy, that of the pubes follows the female type of distribution—horizontal. Small thyroids, thymus, larynx, and wide pelvis are the rule. The average castrate is apathetic, with shambling gait, bent in his posture and a sleepy or indolent mental attitude. The face is usually fat, with puffy eyelids. The voice is high and thin. Erotic desires are not always absent nor is intercourse impossible, even though the penis is apt to be small. The female—artificial menopause—tends to grow stout and irritable, autonomic tonus is lowered, ptoses are frequent, vasomotor instability, with hot and cold flashes, with darting, jumping pains, anxiety, nervousness and flightiness develop.

The pineal gland, the island of Langerhans of the pancreas and the thymus gland are all considered endocrine glands. They are all supplied by the parasympathetic nerves. Their hormones have to deal with metabolism and probably have a very small role to play in a neurological way and should be treated from a medical standpoint rather than from a neurological way.

In conclusion, I wish to say that the clinical syndromes resulting from disease of the glands of internal secretion are almost always, or, I might say always, pluri glandular. The close relationship between the glands of internal secretion and their products with the vegetative nervous system, has been dwelt upon. The psychotic and the neuropsychotic symptoms have been enumerated in taking up the individual glands and their syndromes. The great effect of emotional shock, infection and toxemia upon the glands of internal secretion and their resulting effect upon the vegetative nervous system has been shown.

It would seem that a group of organs—the endocrine glands—which have in their power the regulation of the normal growth of the body, the proper development of the nervous system, the appearance of secondary sex characteristics, the reproductive cycle, metabolism, whether the individual shall be feeble minded, or highly intelligent, a sissy or a he man, a bearded lady or a woman endowed with purely feminine attributes, determines an individual's personality and his reaction to his environment must be highly respected.

I must admit, the field of endocrinology is in a state of chaos. There are many contradictory theories and glandular therapy so far is merei, empirical, but out of the chaos I am sure orderly facts will follow. The field is still open for investigation and indeed it is a most fascinating one.

SURGICAL ASPECTS OF ENDOCRINOLOGY*

W. D. GATCH, M.D.
INDIANAPOLIS

The discovery that there is a chemical control of bodily function in addition to a nervous control has appealed powerfully to the imagination of workers in the experimental and clinical fields of medicine. No subject has been more written about than the function of the ductless glands. The bibliography of endocrinology fills five hundred pages. There is a special journal of endocrinology and a special association for the study of internal secretions. This activity has had a great influence on the practice of clinical medicine and surgery. In fact there are indications that it is having an influence which is not entirely beneficial. It is time to consider how much we actually know about the glands of internal secretion and how much of this knowledge we can safely use in actual practice.

For such evaluation the symposium on endocrinology held at the last meeting of the American Medical Association furnishes adequate material. At this, Barker, Cannon, Aub, Carlson, and Hoskins presented papers, and Roundtree, Wilson, Boothby, and others took part in the discussion. The papers were excellent and the criticism was keen, even acrimonious at times. These men should know the subject if anyone does, and yet I am sure that if any of you will read the published account of the symposium, the one overwhelming impression you will receive is that the subject is at pesent in an extremely chaotic condition. The essayists and discussants themselves repeatedly emphasize this fact. Indeed Carlson's paper is devoted to showing how little evidence there is for many widely believed hypotheses on internal secretions.

Endocrinology consists at present of a few well-established and indisputable facts, a greater number of supposed or undemonstrated facts, and a vast amount of speculation, most of it without adequate foundation.

Says Carlson: "* * * * practically every statement made in regard to the ductless glands today requires qualification." Says Roundtree: "Endocrinology is still young. It is still far from a science." All that is actually known about the internal secretions can be, and is, stated in any good text book of physiology in six or eight pages.

A sense of ignorance is the beginning of wisdom, in endocrinology as in any other branch of learning. All serious workers in this field emphasize the point that what is needed is the patient collection of facts. They also emphasize the extreme difficulty of making progress, to which they consider illgrounded speculation a great obstacle.

(*) Third paper of symposium on Endocrinology presented before the Indiana State Medical Association at the Muncie session, September, 1922.

Notwithstanding the above considerations, every physician should learn all he can about the function of the ductless glands. It is beyond doubt that they govern (1) the growth and development of the body; (2) the sexual functions and the development of the sex characteristics; and (3) that they have a controlling influence on metabolism. No one should today practice surgery without a knowledge of these important facts, but this knowledge should be controlled by a realization of how little we know about the means whereby the ductless glands exercise their functions. The limits of time forbid that I consider in detail the manifold points of surgical interest of the pituitary gland, the thyroid, the pancreas, the adrenals, the sex glands, etc. Such a review would, under the limitation of time, be haphazard and sketchy. I must be content to consider the correct attitude of the surgeon toward diseases, and supposed diseases, of these organs, and how he should proceed with the study and treatment of the individual case. A study of first principles is especially indicated in a branch of surgery so confused and uncertain as this.

An eminent clinician has recently pointed out that much of the uncertainty arising in the study of diseases of the ductless glands is due to confusion of clinical syndromes with theories as to the cause of the same.

In other words we start with a theory of what is causing the patient's trouble and make the physical findings and case history fit the theory. Such placing of the cart before the horse is, of course, a mistake liable to be made in the study of any complaint, but it is peculiarly common in the romantic and fascinating field of endocrinology. It would seem that many men who have pondered over much on this subject have become victims of systematized delusions about it, so persistently do they search till they have fitted every symptom they observe into some endocrine complex.

At the risk of seeming to explain the obvious, I wish to insist that safety in this field lies in first collecting every possible bit of information about the patient, from case history, physical examination, and laboratory tests. Not until these data have been critically examined, the proper relative importance assigned to the individual facts, and everything which is not certainly true rejected, should the clinician seek to discover a cause for what he has observed. Finally a diagnosis of disease of the ductless glands should not be made till every other possibility of diagnosis has been excluded.

In a branch of medicine so uncertain and theoretical as this, these rigid criteria are necessary for safety and progress.

We may illustrate the foregoing principles by considering the study and treatment of so-called hyperfunction of the thyroid. I select a disturbance of this particular organ because more is probably known about the thyroid than any other ductless gland.

Suppose a patient presents himself with a history of extreme nervousness, loss of weight and strength, sweating, diarrhea, increased heart action, etc., and that on examination we find that he has exophthalmos, certain characteristic eye signs, an enlarged and vascular thyroid, a rapid pulse, muscular tremors, and a greatly increased metabolic rate. This is a well-known syndrome which we call Graves' disease. So far we are on safe and certain ground. Beyond this point speculation begins. What is the cause of Graves' disease? "Hyperfunction of the thyroid with production of an excessive amount of its hormone, which causes an accelerated oxidation in the tissues, which produces the clinical manifestations observed," you may answer. You may add that the truth of this argument is proved by the fact that when in such cases the activity of the thyroid is diminished by diminishing its blood supply or by excising the greater part of the gland, the disease is cured. That these surgical measures greatly benefit most cases of Graves' disease is perfectly true, and this is an unanswerable argument for their use. Nevertheless it does not prove that hyperfunction of the thyroid is the cause of the disease. This is only one of several possibilities. The disease may be caused by the excretion of a toxic substance by the thyroid, or it may be produced by stimulation of the thyroid by some unknown agency. We are unwise if we do not at least keep an open mind on this matter. For there are things we do not understand about Graves' disease, *e. g.*, why the symptoms associated with adenoma of the thyroid are not altogether the same as those of exophthalmic goiter, and why all patients are not cured by thyroidectomy performed in the early stages of the disease.

While for practical purposes the management of a fairly typical case of Graves' disease is reasonably satisfactory, what can we say of the diagnosis and treatment of cases which present only a few of the manifestations given above? Suppose the chief symptoms are increased heart rate and nervousness without enlargement of the thyroid? Or some enlargement of the thyroid and auricular fibrillation? Or general weakness and increased heart rate? In cases of this kind we should be especially careful not to let our idea of the possibility of the presence of hyperthyroidism blind us to the possibility of other causes, as pulmonary tuberculosis, various nervous disorders, the presence of latent infection, and possible physiologic activity of the thyroid.

In light of the foregoing considerations it is unnecessary to discuss such surgical procedures as thyroidectomy for the cure of dementia præcox, adrenalectomy for the cure of epilepsy, or ligation of the vas in old men for the restoration of virility.

The principles illustrated in the case of the thyroid are a safe general guide in the surgery of the other ductless glands. It should be borne in mind, however, that with the pancreas, adrenals, and sex glands, the matter of chief surgical interest is that of insufficient function, *e. g.*, diabetes for lack of sufficient pancreatic tissue, Addison's disease from destruction of the adrenals, and the symptoms of a premature menopause from loss of the ovaries. As yet the surgery of these organs is most important from the prophylactic standpoint. Grafting of ovarian tissue I regard as a justifiable operation because it is attended with but little danger and may do good.

The foregoing remarks have been meant to apply to surgical diagnosis and treatment having for its object the relief of disturbed function of the endocrine organs. They apply only indirectly to operations on these glands when they are the seat of tumors or other grossly demonstrable disease. One well established fact makes such operations safe in nearly all cases. This is, that nature has provided a great excess of tissue in the case of every endocrine gland. This excess is six to eight times the normal need of the body for the particular function involved.

SUMMARY AND CONCLUSIONS

In this paper I have emphasized what I regard as the most important aspect of endocrinology from the standpoint of the surgeon. This is the uncertain and fragmentary state of our knowledge about it. In the dark we must move cautiously. Therefore in the diagnosis of supposed endocrine disease, or in the operative treatment of the same, we must employ the most rigid criteria of judgment, and not allow theories of endocrine function to influence us, for today the truth of these theories is almost without exception undemonstrated.

These conclusions do not dispute the great physiologic importance of the endocrine glands; and should not discourage study of their functions. This study should be undertaken, however, with a realization of the extreme complexity and difficulty of the subject.

DISCUSSION

DR. EDGAR F. KISER (Indianapolis): Endocrinology is a science in the making and I am sure it is to be regretted that there is a tendency on the part of many men to decry it as merely a passing fad. Personally, I predict for the future of endocrinology an enormous place in medicine, and I speak of this from the medical side only. The very fact that Dr. McCaskey has been able to present such concrete facts concerning the thyroid is pretty good evidence in itself that with the passing of time and with the study which we will be able to give the relation of the so-called ductless glands, we will have very nearly as definite a statement to make concerning other of the endocrine organs.

Perhaps the outstanding factor in bringing endocrinology into disrepute at this time is the unfortunate over-activity of some men who are exploiting it commercially. Our desks are covered with advertising literature coming from the far West and from the Atlantic, calling our attention to capsules containing this, that or the other substance that will do everything but grow hair on a bald head, and I think the disposition of most men is to jump to the conclusion that anything which is exploited in this way is of but passing interest. I am very sure that with the work that is being done by the better men throughout the country we will within a comparatively few years be able to interpret very intelligently the hyperfunction or the hypofunction of most of the glands of internal secretion.

The problem at this time of course is the matter of treatment, particularly the treatment of those diseases in which there is hyperfunction of some of the endocrine organs. Hypofunction is being satisfactorily met, especially as regards five or six of the more important endocrine organs. We know exactly what thyroxin will do, and what dessicated thyroid will do within certain limits. Personally, I am enthusiastic about the administration of ovarian substance. I believe in properly selected cases we have in ovarian substance a remedy which has been a God-send to a great many women. The use of pituitary substance I do not know so much about, except of course in obstetrics, where it has a limited field.

I am looking forward with eager anticipation to the further development of the work which McLeod of Toronto and his co-workers have recently done on the pancreas. In the *Boston Medical and Surgical Journal* some three months ago was a letter written to the editor by Joslin, discussing this work and speaking of it in such enthusiastic terms that I could not help but feel, coming from such a conservative man as Joslin, that before many months *insulin*, as McLeod has named his product, might offer the possibility of cure in diabetes, which as we know up to this time has been an utter impossibility.

It is such work as this, coming from men at the very head of the profession, that leads me to believe that it is only fair and right that we should judge endocrinology upon its merits, and neither accept nor reject the science as a whole until such time as it has proved itself.

DR. ALBERT E. STERNE (Indianapolis): I think you will agree with me that we know some well-recognized physiologic facts as to the function of the various glands, but these facts are loosely strung together. The influence of the one upon the other is not clearly understood, and the present situation is chaotic and altogether unsatisfactory. A great many men think that they have solved a certain number

of our problems, but therapeutically, at the bedside and in the consulting room, our results do not by any means agree with the demonstrated facts in the physiologic laboratory. It does not work out, and probably for a very simple reason. The human body, with its complex mechanism, is decidedly different from a set of retorts or test tubes or any laboratory apparatus. Therefore what we see, at the bedside, of the phenomena which occur in diseases of various kinds is difficult to total and assimilate with known, demonstrated facts of the physiologic laboratory.

Hypotension is apparently easily met. On the other hand, hypertension has been comparatively illy met in the consulting room and at the bedside.

Another point which I want to barely mention is the fatal influence upon the individual, upon the mechanism of the body, upon the growth of the nervous system, of impairment in function of the chief glands of the endocrine chain (and remember that no link in that chain can be disturbed without influencing the whole chain), except those which have to do with the reproduction of species. That they have an influence is true, especially if they are removed early in life. I question very much, however, whether there is a marked gonadal influence late in life. I think that is largely superstition, and while it may be that ovarian extract has been a God-send, as Dr. Kiser has said, I have been rather convinced that most women come to the climacteric or any disturbance of the ovaries (and men relatively in the same way) in what you might call a psychic state. They think that something ought to occur—they are told it ought to occur. I cannot conceive, gentlemen, of a normal physiologic phenomenon like the climacteric leaving behind any marked disturbance, unless there is something wrong with the individual aside from that. So I believe it is largely a superstition that has been handed down. Women discuss it in their societies—they have an idea that at the climacteric something must show itself from the psychic or nervous side, and then if the doctor can convince them that ovarion secretion or any of the gland products will have a good effect, to some degree they may be relieved.

Practically all operations upon the endocrine system—surgery of the thyroid for instance—are empiric. The same is true of our medication in these cases. There is behind the manifestations, behind the group of complex phenomena in diseases of this system, something else. I think Dr. Emerson correctly touched upon that. It is the primordial nervous function that is fundamental. I, for one, am inclined to regard the ductless glands as a part of the autonomic-sympathetic nervous system, rather than glands *per se*. The integral relationship is so close that it is indeed difficult to determine, even speculatively, which function is primary and which is secondary. The same truth is apparent to me in medical therapy—that in this particular phase of medicine we are dealing empirically with whatever trouble suggests itself.

We may successfully operate for hyperthyroidism by Basedow's disease by removing part of the gland, or by ligation perhaps; but herein we relieve only certain definite toxic effects which are a part only, albeit an important part, of the whole clinical syndrome. The Basedow complex still remains well defined after the operation. This operation has relieved, but not cured. It was an empiric measure.

DR. CHARLES P. EMERSON (Indianapolis): We are fortunate in listening to so splendid a review of the literature of this subject. As Dr. Sterne has mentioned, this literature is so voluminous that one must be cautious when selecting those whose authority he would follow.

In that connection I should like to make a plea that we get away from the old German physiological school and be loyal to the clinical school, for although the one will, or should, use as many test tubes and guinea pigs as the other (for without laboratory work there would be very little advance except in empirical medicine), nevertheless the difference between them is that the German school believed medicine was advanced in the laboratories and that what is proven in the laboratory is proven for the patient, while the clinical school realize that they must start at the bedside and in the laboratories seek the explanation of what they find there. In the field of endocrinology especially is this distinction important, for our ideas on this subject have become very confused because so many of them were gained from the study of animals and may or may not be true of men, and yet much of this animal work is the only ground for the many remedies on sale for these disturbances of the glands of internal secretion. The dealers say to us, "Test our products on your patients." The manufacturers make their preparations and ask practicing physicians to "test" them. Personally, we doubt that much progress can be made testing remedies on our patients about their work—the housewife with her domestic duties—the man with his professional or business cares. There are too many factors to consider. The manufacturers have no right to flood the market with all these preparations until they have been reproven under proper test conditions and with proper patients. That is, it seems to me that a society like this should have these drugs tested and then say, "Now you may sell your product." We are discredited by the things that have been tried on the public in years gone by and then abandoned. We may change our opinions as to certain drugs, but the public only remembers that we did recommend them ten years ago, and therefore we suffer.

Our subject is "The Endocrine System and the Central Nervous System". I am one of those who do not believe that the thyroid gland *controls* anything; it does it under control. I do not believe the adrenals *control* anything. I do not believe the rituitary gland controls anything. Of course if you use the term "control" in the same sense as we do of our automobile machinery when we say this lever "controls" the air, this "controls" the gas, well and good; but these little levers and switches do not run the machine. By means of them I run it. When as a boy I rode a velocipede it did not have levers and switches, but I rode it; then came the high bicycle, then the safety, each a better machine. Now I drive an automobile. The driver is the same. I rode before; now I ride better and have a better machine. Let us carry this argument into comparative biology. If an automobile concern should buy a shoe factory, we would expect the output to be automobiles, not shoes, and yet would see that the shoe factory was the older industry. Now from an embryological point of view what do we find? We find the thyroid gland was in lower animals a mucous gland whose secretion was useful to the tongue, but when the higher animal came into being he commandeered that factory for a very different purpose and made in it a certain internal secretion of immense importance to the body. We find that part of the pituitary gland originally belonged to the nose. Later nature commandeered that factory for a different purpose, in fact, to control sex life and body growth. It is said that the pineal gland was once an eye. In other words, if we believe in comparative embryology at all we must recognize that the nervous system is older than the organs and has used them to suit her changing purposes. These organs do not control; they are merely the machinery which has been developed for this purpose. Today we hear so much about internal secretions since the manufacturers can sell them to us. If they could sell us autonomic nervous systems undoubtedly they would.

Until the medical profession is willing to recognize the fallacy of this scientific period and go back to Greek medicine, which sought the agent behind the machine, until we realize the immense importance of the emotions in controlling body functions, we will not be able to handle this question of the internal secretions satisfactorily.

We must remember that there is no proof that thyroxin is the hormone of the thyroid gland, although we know that it is a very potent drug manufactured from the thyroid gland; that there is no evidence that adrenalin is a physiologic product, although it is a very valuable drug and we could scarcely get along without it. But we must be careful in discussing this subject not to identify a drug made from a gland which may give almost the physiological action of the gland as necessarily the physiological hormone of the gland. But even if they were the true hormones their production represents the activity of the central nervous system, which controls the activity of that gland. We have the great emotional side of our patients to deal with, and if a man is not willing to consider that first, I do not see how he can expect to get very much from using these internal secretions.

The matter is in chaos, and yet we doctors are in a certain degree the "goats". We are the ones who sell the public an immense amount of "internal secretions" products. We certainly get no profit from it now and we certainly will get a great deal of criticism if later we abandon them. We have no right to advise so much therapy of unproven value.

The point I would like to make is this: The real education of the public must begin in the State Medical Association, and this Association must be very careful in determining what it should teach the public and what it should not. If we can get the confidence of the public by proving accurately, first the things we prescribe, then I believe they will obey a great deal more readily when we suggest surgery, for instance in carcinoma.

We are discussing, not internal secretions in general, but the nervous system and the endocrine organs, and we believe it is the nervous system which controls the function of the endocrine glands. You may say this is a quibble concerning the term "control". It certainly is more important than a quibble, since the misuse of that term has led to the experimental use of a great deal of glandular extracts which have never been thoroughly proven. I happen to know the very first man in the world who was ever saved from myxedema. I knew him twenty years after, and he still used thyroid tablets. Try to get the better of him in an argument and you must needs be pretty bright. But here is the point—that drug was first proven experimentally on animals, second, it was reproven on man, and third and lastly it was put into general use. If we had waited for that proof in the case of a lot of these other things on the market, they would not be sold today.

DR. TOM JONES (Anderson): Dr. Gatch was entirely right when he said that from a surgical standpoint, endocrinology is in its infancy. To my mind, with the possible exception of surgery of the thyroid, the surgical phase has not yet been born. When you consider all the different theories you can readily see that the surgery of the ductless glands cannot yet be placed upon a solid foundation. It is necessarily destructive rather than constructive surgery, and deals principally with the hypersecreting glands. It is comparatively easy, purely

from the standpoint of hypersecretion, to destroy part of a gland and stop the excess output of the extract. Theoretically that is true; practically, it is not. Even in surgery of the thyroid we know that many times after the thyroid has been removed the symptoms are not improved. Why is it? That is a question that has not been answered satisfactorily. To my mind, any surgery of the ductless glands, with the possible exception of the thyroid, is extremely meddlesome surgery.

DR. CHARLES H. GOOD (Huntington): We have certainly had a very scientific discussion of the subject of endocrinology, and as general practitioners we know that corpus luteum is a valuable remedy, we know that ovarian extract is a valuable remedy, that thyroid extract and adrenalin are marvelous, but when it comes to pituitary extract I think it is the most marvelous in the history of medicine, and the man who discovered it should rank along with Harvey, Pasteur and Lister, and have a monument in this country. But in the hearts of the mothers of this country pituitary extract will live without a monument.

DR. G. W. SPOHN (Elkhart): Dr. Gatch was understood to say that nature has made provision for the tissues of the body—that is, that there is five or six times as much tissue as is needed. In other words, the thyroid gland has five or six times the capacity the system needs. If he can prove that I wish he would do so.

DR. CHARLES S. BOND (Richmond): I want to compliment the authors, especially the surgeons, upon the very conservative view they take of this proposition. Just a few years ago we went to the other extreme, but now we are coming back, and I think it will be a benefit to the human family. We all have our horizons. We all go into the sickroom, draw the curtains down on all sides to conform with our individual eccentricities, and make a diagnosis according to our view. That view may be very extensive, or it may be based on very little knowledge. Every doctor is more or less subject to mistakes because of his viewpoint. Conservative medicine certainly would be the proper standpoint for the men of this Association, because we will be making mistakes which will count more than not to give medicine at all, or not to do surgery at all. The great trouble now is that we are overdoing everything we undertake. Thyroid extract was introduced, and we used it to excess; the same with pituitrin. We will have to get away from that proposition before we get down to the real facts.

In regard to surgery of the thyroid, you know how many different views are already taken. In the first place, there is disturbance in the body outside of the thyroid, brought about by excess in some particular way, and the thyroid is affected. It makes too little or too much iodine. Do you take out a part of a radiator to stop the heat from coming from the basement? Everybody would say that is very inconsistent, although for the time being the room is less heated. But would it not be better to go down cellar and put out the fire? We are coming to the point where we must not consider single, isolated facts, but all the underlying facts connected with this subject. Not one gland only, but the other glands involved. We must take the body as a whole and study it from that standpoint, not from isolated facts either in medicine or surgery. Then will we come nearer the truth.

DR. GEORGE F. KEIPER (Lafayette): Dr. Bitler touched on one phase of this subject that I think is worthy of very serious consideration—the relation of the endocrine organs to personality. Personality has to do with mentality, and mentality has to do with psychology. Psychology has to do with the individual nerve cells of the brain, the central nervous system. We have learned that it is very hard to tell where body leaves off and mind begins, where physiology ceases its work and psychology begins. If we go into the laboratory for study of the mind we find it is based upon the study of physiology, and the students are started along that line. Max Nordau in his work on "Degeneration" says that after all memory is nothing more nor less than the product of stored-up nerve cell action. So all our psychological processes are the product of nerve cell action. If these endocrine bodies have anything to do with our psychologic processes, and they evidently have, it certainly behooves us as physicians dealing with the mental states of our patients to enter into a very serious study of these endocrine bodies.

DR. CHARLES STOLTZ (South Bend): I have watched, as an innocent bystander, this endocrine theorizing since the days of Brown-Sequard, and it seems to me that most of the stuff is the result of laboratory juggling and ought not to be released from the laboratory until better digested. Then we would not get into such a hopeless muddle.

DR. J. R. EASTMAN (Indianapolis): This has been one of the most remarkable exhibitions of therapeutic nihilism that I have ever witnessed. I believe that much practical good has been accomplished by the study of endocrinology. For example, I believe that we are today in a very much better position with relation to the treatment of toxic thyroid glands than we were twenty years ago, and I believe that a great part of the credit which redounds to the medical profession for this advance is owing to the surgeons who have devoted themselves to the practical study of thyroid disease. I would not be true to my guild did I sit here and willingly permit the impression to remain in your minds which I suspect is there now,

namely, that surgery accomplishes very little in dealing with thyroid disease. I am one of those who believe that a tumor of the thyroid gland may represent the monkey wrench which can disarrange the whole endocrine machine; and I am one of those who believe that often by a simple surgical procedure the monkey wrench can be removed, followed by the smooth running of the machine. Just ask yourselves this question, you older men, you silver-tops here—What was done with toxic thyroid disease before men like Charles Mayo, the elder Kocher, Crile, Miles F. Porter and other men established the surgery of toxic thyroid upon a fairly rational basis? What did we accomplish before their time, and what is accomplished now in the treatment of thyrotoxicosis?

Reference was made to hemi-thyroidectomy in the disease dementia præcox. Inasmuch as no one knows very much about dementia præcox, I venture to say that with the syndrome of dementia præcox in an individual with large thyroid gland, one is justified, if symptoms do not point elsewhere, in assuming that the thyroid gland represents a focus of irritation, a site of endocrine imbalance, and as the removal of the large lobe can do the patient no harm, one is justified in performing a hemi-thyroidectomy in such a case. The results have proven that for some reason these cases do sometimes actually get well. I have personally had several cases of dementia præcox of the agitated type, with goiter, but without true thyrotoxicosis. Three of these patients had been condemned by lunacy commissions; two had been confined in insane hospitals, and yet four such patients after hemi-thyroidectomy are back at their former occupations as school teachers, stenographers, etc.

So I wish to sound this note: We are not altogether in chaos; some good has come out of the study of endocrinology; some good has come out of surgery in thyrotoxicosis.

DR. CHARLES A. SELLERS (Hartford City): It is a deplorable state of affairs when a surgeon is obliged to make the statement Dr. Eastman has made regarding the relation that exists between dementia præcox and thyrotoxicosis or exophthalmic goiter. There was a close relationship between the symptoms of thyrotoxic goiter and dementia præcox in two of my cases, but they were diagnosed as thyrotoxicosis and not dementia præcox. If we are watchful with our patients (and the general practitioner is the one who sees these toxic cases first) we should never make the mistake of sending anyone to the insane hospital when he or she has a thyrotoxic goiter.

As general practitioners we have not given the very early symptoms of disturbed thyroid the attention they deserve. Of course we all believe that the ideal method of handling goiter is to prevent it.

There is not much question that these cases should be handled surgically, but it must be remembered that exophthalmic goiter cases continue to be exophthalmic cases; they are not cured, but surgically relieved.

Thyrotoxicosis in the beginning is curable with rest, but we general practitioners are not giving this method of treatment the thought it deserves. If we could give these patients as much rest as the surgeon does, I am quite certain that we could cure many a case that otherwise would eventually result in a surgical exophthalmic goiter.

DR. GRACE L. HOMMAN (Laporte): I heard Dr. Sterne say that the disturbances which come on at the menopause are psychic. I believe that is not true. He admits later on that the endocrine glands have much to do with the nervous system. I cannot quite understand why we should not have some disturbance when the ovarian secretion is withdrawn, inasmuch as it is a physiologic process. I believe if all the men had to go through the menopause, with its hot flashes and other annoying nervous disturbances, that about ninety percent of them would be called neurasthenics.

DR. GEORGE W. MCCASKEY (closing): I wish particularly to comment on a few remarks made by my good friend, Dr. Emerson. He says that these hormones, the active principles of these glands, do not control anything. Well, that depends perhaps on his definition of "control". If there is any one fact which has been proven beyond peradventure of a doubt within the last decade, it is, in my opinion, that thyroxin in the tissue cells does control the metabolic processes of the body. They will go up with an increase of thyroxin; they will go down with a diminution. It may be that thyroxin, exactly as we know it, is not produced in the laboratory of the thyroid gland; but the studies of Kendall and the close relationship of the functional activity of the thyroid gland to the metabolism seem to indicate that this hormone with a certain kind of iodine does, in the sense in which I would use the word, absolutely control certain metabolic processes of the body. The nervous system of course controls the hormone output, and it may be that this is what Dr. Emerson has in mind. But the nervous system itself is just as dependent upon thyroxin as any other tissue, and its metabolism is equally controlled by thyroxin.

I do not know that I can agree with Dr. Emerson that we do not know that any of these hormones as such actually exist in the blood. It is true, for instance with reference to epinephrin, that the adrenal gland and all of its constituents have been subjected to violence, they have been destroyed, and these products might easily be synthetic. But how about the fact that there is something in the blood in the lumbo renal vein which can be demonstrated

pharmacologically to produce the same effect as adrenin.

The limitations of our knowledge are great. It has been brought out that destruction of the cortical substance of both glands will produce death. No single chemical body has ever been isolated from the cortical substance that furnishes any explanation of this fact.

Referring to the hypophysis, we have no reason to doubt that it does in a sense control growth. The only substance known to science today which is derived from the anterior lobe is tethelin, the only physiologic product like adrenin from the suprarenals.

In spite of all its drawbacks and the improper state of development in many directions, endocrinology is essential in the diagnosis and treatment of a very large number of cases. Neither the internist nor the surgeon can get along without it.

DR. C. C. BITLER (closing): Endocrinology is a most important subject. The endocrine system is so closely linked with the vegetative nervous system that to have a comprehension of the endocrine system with its effects you must have a clear conception of the vegetative nervous system and its workings.

The internal secretions undoubtedly have a great influence on the individual's personality and his reaction to environment.

DR. W. D. GATCH (closing): I might compress my paper into one sentence: The most important fact in our knowledge of the endocrine organs is the limitations of our knowledge. This should make us conservative and careful about what we do in diagnosing supposed endocrine disease, and especially cautious about performing serious surgical operations on this diagnosis.

In regard to the question which was asked about the normal excess of endocrine tissue, I did make the statement that there is a large margin of safety provided by nature in all the endocrine glands. I think that is established clinically and experimentally in all of the well-recognized endocrine glands. You can excise up to five-sixths of a thyroid gland and the patient will manifest no symptoms of insufficiency. The same thing is true of the adrenals, experimentally. I might point out that the very fact that nature has provided such a large margin of safety in these glands makes it extremely difficult from a diagnostic standpoint to recognize small degrees of hypofunction.

I did not say that thyroid surgery was useless. I practice thyroid surgery and believe in it heartily. I was simply pointing out the necessity for going slowly and for ruling out other possibilities before we resort to thyroid surgery. I selected the thyroid because we know more about it than any other ductless gland. If our knowledge is incomplete there, how much more so must it be with regard to the other glands.

EPIDEMIC JAUNDICE*

S. C. WATERS, M.D.
MIDDLETOWN

The nomenclature of jaundice, like others we have inherited, is not satisfactory. The naming of a disease after a terminal symptom cannot be considered scientific, while the other terms connected with it are used in such a haphazard manner that it creates confusion. The name infectious jaundice is used by various writers for at least three different conditions: Weil's disease, jaundice when secondary to some other disease, such as pneumonia or some septic infection, and the form described in this paper. But while the terminology as used is unsatisfactory, it would be fully adequate if writers were more exact in its use. The disease to be discussed in this paper will be distinguished as epidemic jaundice as this describes it, and that it may not be confounded with catarrhal jaundice, Weil's disease or secondary infectious jaundice.

Our text books, under the head of catarrhal jaundice, after describing the symptoms and giving the cause as stone, bacteria and chemical, make the brief statement, "It may occur as an epidemic." But an epidemic as extensive as we experienced, which ran as true to type, with as selective a location, must have a specific cause.

An acute infectious jaundice called Weil's disease can be excluded for it differs in occurring in males most frequently, occurring during the summer months, in patients between the ages of twenty-five and forty, is somewhat occupational, as ditch diggers and butchers are more susceptible, and this is probably the form affecting armies. It probably is a more serious disease than epidemic jaundice. It very likely is the form of jaundice in which the Japanese investigators found a spirrillum that they named leptospiro icterohaemorrhagiae. This organism appears in the blood of patients on the second or third day and in the urine on the eighth day. It can readily be cultured by intravenous or intraperitoneal injections of the urine in animals.

The redundancy of this name has apparently impressed the United States Health Service and various writers in this country for they have assumed that the epidemic of jaundice occurring in this country was caused by it. But numerous investigators in several hundred cases examined have failed to find it in a single case. Rats have been found with what is supposed to be an identical organism. While the New York State Board of Health studied epidemic jaundice, one of the laboratory workers accidentally inoculated herself with the rat infection. She ran a course of infection differing in many respects from the epidemic jaundice and

(*) Presented before the Section on Medicine of the Indiana State Medical Association at the Muncie session, September, 1922.

although the published report stated that "there was no connection between this case and the cases of jaundice being studied", this is overlooked, and the public press published, and many doctors believe, that the cause of epidemic jaundice was definitely established.

Blood and urine from some of my patients was sent to the Rockefeller Institute of Medical Research but proved negative.

For many years an occasional paper has appeared describing epidemics of jaundice occurring at camps and colleges without much attempt at classifying the form. Herriman of New York City, in 1913, described an epidemic appearing at a child clinic with 98 cases, and again in 1917, one with 24 cases, nearly all occurring in children between three and ten years old. He was the first and only one to classify it as a disease of childhood. At that time he was of the opinion that it was a mild form of Weil's disease; "that the infectious material enters the body through the nasopharynx; that it is a primary infection of the liver and not an ascending infection from the duodenum; that there is no evidence of its being conveyed by food or water; that the infection takes place by direct contact; that it is only slightly communicable, for most persons have a natural immunity and that one attack renders a person immune; that it is more common in children because they are more susceptible and have not been immunized by previous attacks; in camps (and the same applies to colleges) because a number of susceptible and non-immune persons are brought in contact."

Within the last two years frequent reports of epidemics of jaundice occurring in many of the northern states have been made, so they have apparently become more frequent or are attracting more attention than formerly. Endemic cases may occur at any time but so far as recorded the epidemics have been confined to the late fall and the early winter months.

Epidemics of jaundice may not be as uncommon as they are unnoted. A number of years ago nearly all of the pupils in a country school in our neighborhood were jaundiced.

For ten weeks following October 1, 1921, Middletown and its immediate vicinity, with a population of about 3,000, equally divided between town and country, had at least 150 people affected with a gastro-hepatic disturbance that terminated in jaundice. This is a greater proportion than heretofore have been affected with any other one infectious disease at one time, including influenza. There were no fatalities, but the total morbidity was great and the loss from school and work considerable. During this time many cases appeared at Bluntsville, twelve miles to the east, and at Markleville, the same distance to the west of Middletown. Other cases appeared at towns bordering this area. This probably marks the extent of territory invaded by the epidemic.

Forty cases were studied and tabulated. This included only the worst cases in which jaundice was well marked. The tabulation does not include cases with all of the other symptoms, or some of them but were not jaundiced, those of the family that have had the same thing but were not seen by me, those waited on by other doctors or others known of but had no doctor, but only cases seen by me personally[1].

These cases had all been in contact, they had all used city water, but this had proved good immediately before and during the epidemic. Food could be eliminated as a cause on account of the wide distribution of the cases.

The first two cases were illustrative of the entire series.

Case 1. Young man, clerk in grocery, suddenly taken sick with vomiting and pain in stomach, tender over liver. Temp. 101. This continued for four days, complained greatly of soreness over body, especially limbs, "as if he had been pounded, and felt like he was drunk". He lay or sat in a listless manner and looked quite sick. On fifth day he spoke of peculiarly colored urine, and on examination found it heavily charged with bile. I prognosed that jaundice would appear. On the seventh day of his sickness he was quite icteric, but was up and around and rapidly grew better. Three weeks after his sickness he reported that he never felt better and weighed more than he ever had.

Case 2. Delicate school girl aged nine years, living just across the street from Case 1. Taken sick in same manner, suddenly vomiting, pain in epigastrium. Vomiting and pains continued for ten days. Temperature reached as high as 103. Epistaxis, vertigo, diarrhea at first. Bile in urine on fourteenth day, but skin and sclera did not show it until the twentieth day. While she was sick I was called to neighboring family to see two brothers in same bed with primary symptoms, and to see three children in one family in the country with the same. And from this it extended.

A case history of each would not be of interest as they ran much the same course and a summary of my forty cases will suffice: Living conditions, both good and bad. Sex, equally divided, twenty males and twenty females. Ages, 3 to 23, one exception was 39. Thirty, or 75 percent, were of school age. Five were under and five were over school age. Previous health, the delicate were more sick and more susceptible—one exception, a fourteen-year-old girl in advanced pulmonary tuberculosis, who

(1) Some of the untabulated cases were of great interest. Four infants in families with jaundice had all of the symptoms but were not icteric. One five-month-old baby, entirely breast fed, had a temperature of 105. One six-pound baby, born of healthy parents, twenty-four hours after birth had vomited, a temperature of 104, and became icteric. This all continued for ten days, when at the request of parents and on advice of consultant, surgeon reluctantly operated and found inflammatory adhesions constricting duodenum about one inch below pylorus.

has since died, ran a mild course. None had acute respiratory symptoms. Four had had their tonsils removed. Prodrome:—This was indefinite as I saw but few cases the first two days. Some had chill but not pronounced, the most of them slight fever from one to three days, one for ten days. Temperature from 100 to 101, the highest 103. If any prodrome before vomiting it must have been short. All complained of malaise and nausea, soreness rather than aching, none complained greatly of headache. One six-year-old boy had an initial convulsion[2]. Dizziness was a very constant and early symptom. One on arising in the morning started for another room to build a fire but had to sit down to avoid falling, later vomited and ran regular course. Diarrhea occurred in only four cases, the others had taken cathartics. Vomiting was an early and constant symptom, but varied from once to several times a day for ten days. The average case vomited for three days. Vomitus showed no peculiarities, only stomach contents and secretion, no excess of mucous or bile. Laboratory examination revealed nothing bacteriologically. One reported blood in vomitus. Pain was synchronous with vomiting and was of varied severity, none required hypodermics of morphia. The location of pain invariably over the epigastrium. Liver but slightly enlarged in few cases, in some it apparently could be outlined more plainly than normally. Icterus occurred on the fifth to twentieth day. Only one on the twentieth day and one on the twelfth day, twenty showed on the seventh day, or in just half of the cases.

Jaundice was of various grades, from light lemon to greenish yellow, always plainest in sclera. Some said it rubbed off on sheets. It lasted from two days to two weeks. Puritis of various degrees generally occurred when icterus began to fade. Bile showed in urine one or two days preceding appearance of icterus of skin or sclera. The average loss of time from school or work was two weeks. Stools very offensive and usually clay colored but sometimes bile continued to show in them.

In seven instances and in 50 percent of the cases more than one member of the family was affected at the same time. If there is an incubation period it must be very short, for there were no successive cases, but the different members were taken sick within a few hours of each other. There was one exception, two were taken sick one week after two others had it.

Recovery was usually prompt after appearance of icterus, but they all had the appearance of having been through a severe sickness. Some reported an unusual appetite after recovering, while others appeared anemic.

(2) I know of one other five-year-old boy who had an initial convulsion.

Treatment: They had all taken physics before I saw them, and I gave very little thereafter for I found it increased the irritation and pain of the diseased parts. Other treatment was symptomatic. Used various intestinal antiseptics; for vomiting, gave chloroform water; for pain, camphorated tincture of opium was satisfactory. Hexemethelanamine or phosphate of soda and murate of ammonia have been suggested as satisfactory treatment. Many of them were given ferruginous tonics during convalescence.

These cases intrigue one to speculate on the future of these patients—will this acute disease leave a permanent nidus for chronic disease of the gall ducts and bladder and the duodenal tract? That it could cause very serious sequela was very decisively shown in two cases. One nine-year-old girl, three weeks after onset of the disease and one after apparent recovery, after definite exposure, developed an acute diffuse nephritis, fever, severe headache, edema of hands, feet and face, 1 percent of albumen in urine. The other girl of eleven, five weeks after onset and two weeks after apparent recovery had severe chill, temperature 104. short, painful respirations, lying on right side with thigh flexed on abdomen, right shoulder drawn down, painful to move or change position, tender over slightly enlarged liver, slight, painful cough with light rales in lower right lung. She recovered after seven weeks' severe illness.

A study of these cases, considering its intense malaise, seasonal and age incidence, its selective action, and the minor importance of the fever, has led me to the conclusion that the cause of the epidemic is the same as the cause of the epidemic of influenza in one of its protean forms, or another of as mysterious and subtle character. That it should be a spirrillum necessitates the presence of an intermediary agent. The disease occurring during the season when there are no flies, mosquitoes or fleas and in a sanitary district where malaria, typhoid and diphtheria are unknown does not seem reasonable.

Conclusion: Epidemic jaundice is an entity, and distinct from catarrhal or infectious jaundice. The cause is unknown, but probably belongs to the same class or is related to influenza and lethargic encephalitis. It is essentially a disease of youth. Active catharsis is not indicated in its treatment. It is capable of grave sequela.

DISCUSSION

DR. W. M. STOUT (Newcastle): After listening to this very interesting and excellent paper I cannot help feeling that we are more closely acquainted with this disease which he has termed "epidemic jaundice". The thought has occurred to me that this should be made a reportable disease and one which we can quarantine. First, it would impress the medical profession with the disease of epidemic jaundice.

Second, by quarantining these cases we would be able to reduce both the morbidity and mortality, and third, we would have statistics from which to work, if the doctors would do the work conscientiously.

Living within a radius of twenty miles from Middletown, where this epidemic occurred, it was my good fortune to observe four cases. The first case was that of a girl of four years and was similar to those Dr. Waters described. I did not make the diagnosis of jaundice until I found that the child had been spending two days in Middletown. Two other cases, a girl of three and a boy of six, ran the typical course. A cousin of these children who was brought in while they were running the septic course developed a similar condition. This impressed upon me the infectious nature of the disease. The parents did not develop the condition, although they were comparatively young. One thing that was marked in these cases was a tenderness over the liver and the possible enlargement of the liver.

The route of the infection comes up for discussion. It is possible that it occurred through the nasopharynx, or that it began secondarily in the stomach and ascended to the liver through the lymphatic and blood streams. One observer has even reported that it might resemble paratyphoid B.

We will have to concede that there are four main types of jaundice: First, acute catarrhal jaundice; second, that due to gall stones; third, that due to cholecystitis, and fourth, that due to malignancy. The epidemic type resembles the first more closely, and it is yet to be seen whether there is a resulting cirrhosis.

These epidemics have frequently been encountered in schools and colleges far distant from research centers, and for that reason the pathology is in a more or less uncertain state at present.

DR. WILL SHIMER (Indianapolis): I think this paper should give everyone considerable encouragement, because Dr. Waters has described the symptoms, the course, the probable etiology and the method of transmission as well as it could be described by anyone. He has not had much laboratory or other assistance, but has worked it out himself.

Dr. Wadsworth, of the New York State Board of Health at Albany, had a good opportunity to study these cases. He started out with the idea that it was due to the leptospiro-icterohemorrhagica and investigated the possible presence of this organism in the blood and other parts of the body, but was unable to find it. Dr. Noguchi, who had the first chance in America to describe the leptospira, was unable to find them in these cases.

One of the other causes of jaundice is B. paratyphoid. Wadsworth cultured the blood and the urine, but was unable to find any bacillus paratyphoid, so the New York State Board of Health did not succeed in finding the cause of their cases. They did find out that the disease was easily transmissible from one person to another. Cases were treated in Albany hospitals and nurses taking care of the children were easily infected with the disease, the incubation period being seven days. It is not only transmissible among children but among adults, and the cases run the typical course in adults as in children.

With reference to the possible mode of transmission, assuming that hospital nurses would take the proper precaution with reference to being infected with urine and feces, we are left to the respiratory tract.

As to the nature of the organism, I do not believe that epidemic jaundice is caused by the same organism that is responsible for influenza. Neither is it generally recognized that lethargic encephalitis is caused by the same organism. It may be that epidemic jaundice lowers the resistance, but these patients always had a leukocytosis of eight to ten thousand, which is the reverse of influenza. The whole thing is up in the air, but Dr. Waters has described an epidemic which is the first of the kind to be described by physicians in Indiana, he has done it with limited facilities, and has given data which will compare favorably with data collected by trained experts. It is evident that there are many epidemics of jaundice, and not only are the doctors of Indiana overlooking it, but the doctors of Ohio, where no such epidemics have been recorded. Since it is common in New York and Pennsylvania, I assume that it is common in the adjoining states but has not been reported.

Dr. Waters deserves considerable commendation for the way in which he has described it. His conclusions in reference to the disease are worthy of consideration.

DR. W. A. FANKBONER (Marion): It has been a question in my mind whether this disease is not a post-war condition, as is the epidemic type of encephalitis. It is very evident in the study of this type of encephalitis that it is a post-war condition. It followed in Europe the lines of transportation and spread very largely along lines of transportation, and after the world war was widely epidemic. It seems just as reasonable to suppose that this travel factor may be operative in the spread of epidemic jaundice. The most practical working hypothesis is that it is an air-borne disease, the invisible vapor that is coughed out or sneezed out carrying the infection, keeping in mind also the matter of direct contact. It is pretty well determined that epidemic encephalitis is so transmitted, although it gives no evidence of the high degree of sensitivity that Dr. Waters has shown us in epidemic jaundice. It is just as

reasonable to decide that an infection of the upper air passages can localize itself about the bile apparatus as it is to accept the well-established fact of other selective localization of infections.

DR. W. W. WADSWORTH (Muncie): Dr. Waters' paper is a valuable study and shows close observation, analysis and classification of the varied phenomena through which these cases passed from onset to resolution. He has given us a fine example of student quality in his report on epidemic jaundice.

Just a word as to the communicability of this infection. It has been contended that epidemic jaundice, like epidemic encephalitis, is of unproven origin and indefinite contagion. However, it has been assumed that its transference is through association or individual contact. It may therefore be assumed that in a small community the victims of the epidemic were more or less closely associated. Did not the children attend the same schools, Sunday-schools and churches? Is it not reasonable that this infection, like that of kindred epidemics, is through respiratory contact?

DR. CHARLES A. SELLERS (Hartford City): From an etiological standpoint, I believe we were all in agreement that anterior poliomyelitis did follow our lines of greatest travel. I believe acute epidemic jaundice will do the same thing. In the year 1915 we had an epidemic of jaundice that limited itself to the school children. At that time we had opened up a new swimming pool in our high school. The English had to close their bathing pools during the Boer War because of epidemic jaundice.

DR. S. C. WATERS (closing): The Epileptic Village that lies within the affected area had fifty cases of jaundice during the epidemic. Only inmates were attacked. These use tin cups for drinking purposes. The attendants, who use glasses, escaped. You can draw your own conclusions.

All the epidemics I have heard or read of have occurred during the months of October, November, December and January, so this is the time of year to be on the lookout for it.

PRESUMPTIVE TEST FOR THE ETIOLOGIC FACTOR IN BACTERIAL FOOD POISONING

Victor Burke and Charles W. May, Puliman, Wash. (*Journal A. M. A.*, Nov. 11, 1922), have devised a rapid test for the etiologic factor in bacterial food poisoning, of such a practical nature as to be readily applied by the practicing physician lacking access to a diagnostic laboratory. The test consists of a rapid, confirmed test for the toxin of *Clostridium botulinum* (*B. botulinus*) combined with a slower presumptive test for organisms of the paratyphoid-enteritidis group. There is also described a rapid presumptive test for the presence of botulinus toxin which may be used when botulinus antitoxin is not available. The application of this test in a recent outbreak of botulism, with the resulting diagnosis and case history, is included. In testing to determine the presence and nature of the poisonous substance in a jar of canned asparagus, 2 c.c. of the unfiltered asparagus liquor was placed in each of five serum tubes. To the asparagus juice in the second tube was added 1 c.c. of Type A botulinus antitoxin. To the third tube was added 1 c.c. of Type B botulinus antitoxin. The fourth tube was placed in boiling water for ten minutes. To the fifth tube was added 0.5 c.c. of a 10 percent solution of hydrochloric acid, which was allowed to stand ten minutes. The contents of all five tubes were then neutralized to litmus with a saturated solution of sodium bicarbonate. The contents of each tube were then injected into the marginal ear vein of a medium sized rabbit. The results obtained indicate that the asparagus contained a botulinus Type A toxin.

LEUKOPLAKIA BUCCALIS

H. H. Hazen and F. J. Eichenlaub, Washington, D. C. (*Journal A. M. A.*, Oct. 28, 1922), report ten cases which illustrate that syphilis represents an accidental rather than a causative factor in this disease. The use of tobacco is not necessarily a factor. Rough teeth, by causing mechanical irritation, inaugurate the disease in the vast majority of cases. Etiologically, leukoplakia is analogous to keratosis of the skin, in that the former is a defense reaction against mechanical irritation in the mouth, the latter a defense reaction against the actinic rays or mechanical irritation, or both, on the skin. Each develops as a result of functional overactivity. These cases are extremely rebellious. They tend to remain stationary or gradually to progress over a period of months or years. They are distinctly precancerous. Antisyphilitic treatment is of no avail, and need not be considered in the treatment. Some of the earlier cases will clear up if the source of irritation is removed. As tobacco is undoubtedly a very important factor, its use should be interdicted. If the cases are very extensive and severe, no treatment is likely to avail, even radium being useless. In the authors' hands, the best agent has been the cautery. This is used at red heat, with local anesthetic. With a little experience one can learn to burn deep enough to destroy all leukoplakia, and yet leave a functioning membrane.

EDITORIALS

OUR HOLIDAY MESSAGE

THIS December number of THE JOURNAL comes at the close of another year. To many it has been a year attended with accomplishments that mean satisfaction with individual effort, while to others it means the closing of a year that has been attended with failure to attain the results desired. However, with the beginning of the new year we have a right to look forward with optimism concerning what is in store for us in the future providing we begin the year with a determination to win in all of our legitimate undertakings, and it is but a laudable ambition to desire to forge ahead in the struggles that fall to the lot of everyone who has success as his goal. During the last few years the whole world has been in a restless, unsettled condition, and this has been felt in the United States as well as in Europe. There seems to be an undercurrent of opposition or antagonism to the established order of things. This feeling is felt in politics, religion, business affairs, and even in the practice of medicine. The public seems to be bent upon chasing rainbows in efforts to secure relief from disease conditions, and in consequence the educated and well trained doctor sees many of his best patients, for no reasonable or logical cause, seeking relief at the hands of various brands of rubbers or kneaders and wily faith healers of one kind or another. A little sober thought and analytical reasoning on our part will show us that right always prevails in the end, and since the days of Hypocrates there have been many forms of quackery and many kinds of pseudo-medical cults that have sprung up, thrived for a time and then died, whereas the regular practice of medicine has continued to live and every day grow in importance because of the progress that has been made and the great work that has been done for suffering humanity. There is, however, a time for introspection, and with the closing of this year and the dawn of a time when, through custom, good resolutions are made, why wouldn't it be a good idea for us to study our failures, and in particular any failure on our part in taking the public into our confidence in the dissemination of knowledge as to our aims, objects and accomplishments? If we have failed to do our part in protecting the public from the delusive teachings and practices of the quacks and pseudo medical cults, and there is every evidence to show that we have failed in that respect, is it not a duty that we owe to ourselves as well as to the public to start a new order of things with the coming year to the end that truth will prevail? This will be realized at an earlier date than it will be if we are apathetic. Just as there is need for great reconstruction work in politics and business, so is there need for reconstruction work in our profession, to the end that the greatest good for the greatest number may be secured. We need a closer affiliation of medical men, a greater respect for the opinions of each other, and above everything else, a good deal more activity for the good of the many rather than for the individual himself. We need solidarity, and a unity of purpose in our medical organization, with every member working for the common good. We do not need any new ethics, but a strict adherence to the ethics that supposedly have governed medical men for a century. We need to cultivate to a greater extent a feeling of brotherly love, and we need also to adopt more rigid rules pertaining to the question of honesty and integrity in these times when commercial trickery and chicanery are so prevalent as a means of financial gain. In wishing the readers of THE JOURNAL a Merry Christmas and a Happy New Year, we also wish to express the hope that throughout the coming year the medical men will see as they have never seen before the necessity of joining hands in one solid phalanx in the fight for everything that is progressive, honorable and just in the practice of medicine. If we do this we not only shall accomplish great things for the public as well as for ourselves, but we will have the satisfaction of accomplishments that will merit the respect and approval of everyone and give the utmost satisfaction to each of us as individual physicians.

EXAGGERATED CLAIMS FOR MEDICINAL PREPARATIONS

Doctors should be on their guard when accepting the claims of manufacturers concerning the curative or therapeutic effects of certain remedies that are offered for use of medical men, generally with very exaggerated claims as to virtue. It is perfectly natural that the manufacturers should attempt by every conceivable way to increase the sales of their products, and even though the literature that is sent out sometimes is temperate in statement, the traveling representatives often are quite the opposite and go to extremes in claiming all sorts of unpossessed virtues for the particular products that

they are introducing to the medical profession. Because these representations of both manufacturers and their representatives are so unreliable, no doctor is justified in putting faith in anything that is offered to him without learning something about the trustworthiness of the recommendations that have been made. This is where the Council on Pharmacy and Chemistry of the A. M. A. comes in and offers a service to the medical profession that is deserving of the greatest confidence. In fact, it is the only clearing house through which the medical profession is able to determine in an unbiased as well as perfectly trustworthy manner the virtues of all preparations that are offered to the medical profession for use in treating diseased or abnormal conditions of the human system. Unfortunately there are some doctors who seem to think that they do not need the advice and counsel of such a representative body of men as those composing the Council on Pharmacy and Chemistry, and it is because of this fact that manufacturers of untrustworthy pharmaceutical products are able to thrive and profit. One of the first questions asked concerning a new product should be whether it has been approved by the Council, and if so how far does the approval go in sustaining the assertions of the manufacturers. Oftentimes the first claims for a new product are sustained, but immediately upon having the product approved the manufacturers or their representatives begin to add to the claims to the extent that unpossessed virtues are given the product and in consequence the users are misled and imposed upon. There also is another phase of the question which has to do with extravagance of even legitimate claims concerning virtue. As a concrete example of this, we cite the case of mercurosol, broad claims for which in the treatment of syphilis have been made by the manufacturers. The claim has been put forth that mercurosol is a superior mercurial preparation and not only preferred, but more efficient than other mercurial preparations in the treatment of syphilis. In reality it seems to have been proven (Cole, Driver and Hutton in the *Journal of the A. M. A.*, November 25, 1922) that the results are not better than secured with the old and tried mercurials. In fact it has been shown that in a considerable percentage of instances the patients became worse following treatment with the drug, and some showed no improvement. It also comes very far from having the high spirocheticidal value which the printed data of its manufacturers claim. The effect on the Wassermann reaction over a short period of time was practically nil. The drug when given intramuscularly seemed to be moderately well tolerated, but not any better than red iodide of mercury. Intravenously, however, in four of twenty-three patients, a sclerosis of the vein developed—this in spite of the claims that there is no deleterous action of the drug on the vein walls. In fact, the report seems to discredit most of the claims put forth by the manufacturers, and only goes to show that doctors should be skeptical about accepting the recommendations of the manufacturers of any remedy, and to rely more upon the opinion and recommendations of such an experienced and trustworthy body as the Council on Pharmacy and Chemistry.

POOR CALIFORNIA

The chiropractors of California, through an adroitly worded bill and a clever and misleading propaganda, appealed for an independent chiropractic licensing board to the sympathy and a lack of understanding on the part of the voters of the state, and at the election of November 7, under the initiative, they won. They carried along with them the struggling osteopaths, who were given an independent licensing board of their own. Now the people of California can have their back bones chiropractically analyzed and adjusted, and their inflamed appendixes osteopathically rubbed to the point of rupture, by any person whom the State Board of Chiropractic Examiners or the Board of Osteopathic Examiners of the state of California, as the case may be, sees fit under the law to set loose on the suffering community. The Board of Medical Examiners of the state of California is relieved from all duty and responsibility in the premises. The only evidence of state sanity from the medical standpoint in the California situation, as far as was disclosed by the recent election, was the defeat of the measure which aimed to prevent the use of living animals for research designed to advance medical science and the welfare of men and dumb animals.

What chiropractic is, the California law does not say. One licensed by the board of chiropractic examiners is authorized "to practice chiropractic in the state of California as taught in chiropractic schools or colleges; and, also to use all necessary mechanical, and hygienic and sanitary measures incident to the care of the body;" but his license does not authorize "the practice of medicine, surgery, osteopathy, dentistry or optometry, nor the use of any drug or medicine now or hereafter included in the materia medica." The law creating the board of osteopathic examiners omits altogether any definition of osteopathy, but provides that the board shall in respect to all matters relating to graduates of osteopathic schools, applying for or holding any form of certificate or license, take over, exercise and perform all the functions

and duties imposed on and heretofore exercised or performed by the board of medical examiners.

What a chiropractor and an osteopath may do under licenses issued by these new boards will doubtless be determined in the courts, if interested prosecuting officers can be found who will bring prosecutions in cases of apparent violation of the law. It is said that the chiropractors will be entitled to sign birth and death certificates, be health officers, and fill any official position connected with the practice of medicine and public health.—*J. A. M. A.*, Nov. 18, 1922.

EDITORIAL NOTES

DEAR DOCTOR:
THE JOURNAL and the Cooperative Medical Advertising Bureau of Chicago maintain a Service Department to answer inquiries from you about pharmaceuticals, surgical instruments and other manufactured products, such as soaps, clothing, automobiles, etc., which you may need in your home, office, sanitarium or hospital.
We invite and urge you to use this Service.
It is absolutely FREE to you.
The Cooperative Bureau is equipped with catalogues and price lists of manufacturers, and can supply you information by return mail.
Perhaps you want a certain kind of instrument which is not advertised in THE JOURNAL, and do not know where to secure it; or do not know where to obtain some automobile supplies you need. This Service Bureau will give you the information.
Whenever possible, the goods will be advertised in our pages: but if they are not, we urge you to ask THE JOURNAL about them, or write direct to the Cooperative Medical Advertising Bureau, 535 N. Dearborn St., Chicago, Illinois.
We want THE JOURNAL to serve YOU.

THE season's greetings to all!

PAY your medical society dues now while the matter is fresh in your mind.

WE learn that there are a few misguided members of the medical profession, probably bent upon making money no matter how they make it, who are disciples of one Dr. Abrams, of San Francisco, who has been in the limelight for the last few years as an exponent of a form of pseudo-medicine that is the rankest kind of fakery. To such we recommend the series of articles concerning the preposterous claims of Abrams that have appeared in the *Journal of the A. M. A.* under various dates and copy of which may be obtained by writing the Propaganda Department of the Association.

WITH the beginning of the New Year we hope that the various committees of the Indiana State Medical Association will begin to functionate if they have not done so already. We know that the legislative committee has been busy for some weeks, but what about the other committees? Of especial interest to the medical men of Indiana are the results that should be accomplished by the committee in Industrial and Civic Relations. We hope that that committee will not be a committee in name only, but that it will do some real constructive work in the economic interests of the individual members of the association.

KNOWING Dr. Hurty as we do, we expect great things of him in educating the public concerning the aims and objects of scientific medicine. If he can impress the public through the newspapers and by word of mouth as he addresses lay audiences, as to what modern scientific medicine is and that the people need doctors as expert advisors just as they need electricians, engineers, architects and other technically trained men, and that fakirs and cults are dangerous because they are ignorant, he will accomplish much in the interest of better health and create a higher appreciation of the services of well trained medical men.

THE chiropractors are using full page illustrated advertisements to attract patients, but then that is no worse than what is done by certain supposedly ethical members of the regular medical profession who take up full pages in the photogravure sections of lay publications, or several pages in popular magazines. The chiropractors also are making use of some wonderful signs illuminated by varicolored electric lights, and in some places occupying almost the entire front of a building. Surely the members of the regular medical profession who are bent upon placing themselves before the public by means of advertising are not going to let the chiropractors get the best of them. Why not get up a contest and give a prize for the ones who can create the most attractive and best pulling advertising?

ON the first of the year the Indiana legislature will convene. We hope that the Indiana medical practice act may be strengthened to such an extent that law breakers, so far as pertaining to the practice of medicine, may be punished in a suitable manner. There will be those who will try to nullify the effect of the existing medical laws, and the pseudo-medical cults will try to secure legislation favorable to them which would in effect place the people in Indiana in a position whereby they will have no protection from incompetents. The legislative committee of our association has a great work to do in connection with these various legislative problems and we sincerely hope that every member of the Indiana State Medical Association will give this committee active support and this means not only moral support, but assistance in the way of time and money if called upon for such in order to work most effectively.

THE opticians of the country sponsored a "Better Vision Week" and gave the public, through newspapers and lectures before various societies, their ideas concerning the need of glasses. We have been rather amused to see the chiropractors take advantage of the situation by advertising boldly that chiropractic treatment will in many instances enable persons to do without glasses. Even Cancer Week was utilized by some chiropractors in advertising to the effect that chiropractic treatment tends to place the patient in a position to resist the ravages of cancer. The merits of advertising have been proved time and again, and no doubt there are plenty of gullible people who will believe what they see in advertisements, but we have been wondering why the various better business bureaus, and the national and local advertising clubs that have been having as their slogan "honesty in advertising," have not seen fit to place the stamp of disapproval upon misleading and delusive advertising of the pseudo-medical cults.

THE Religious Liberty Association of Indiana, Illinois, Wisconsin and Michigan, asks us to oppose the movement for Sunday law enforcement which it is thought would menace the freedom of the press. It is reported that the protestant churches are to go into politics for the purpose of and with the particular demand for the enforcement of a Sunday rest law, and that a state wide campaign is to be instituted in the State of Indiana.

We do not think that any great amount of force will be put into the contemplated move and for the reason that some of the most devoted members of the protestant churches would oppose such action. Not only is sectarian influence in State and municipal affairs objectionable, but our religious liberty is not to be tampered with. We do not believe any considerable number of people will sanction any attempt to regulate or influence the observation of religious duties or in any way interfere with what belongs to the conscience of each individual.

MANY doctors are members of churches and various organizations supported or sponsored by churches, and such doctors have a right to protest against the attitude of the various religious organizations that through their officers are upholding and actually working for some of the pseudo-medical cults. Some of the leaders in the Y. M. C. A. and Y. W. C. A. activities actually are "tooting" for chiropractors who at the present time are law breakers, to say nothing of being incompetents, yet these same ring leaders in Y. M. C. A. and Y. W. C. A. work are soliciting endorsement and financial support from reputable members of the medical profession. We have no objection to the preferences shown by ministers, Y. M. C. A. or Y. W. C. A. secretaries, for legalized and reputable practitioners of medicine, but we do think that it is time for withdrawal of support of those religious workers when they not only uphold quackery, but actually work for quackery's advancement. If the church and various religious associations as organizations or through their officers are going to support the pseudo-medical cults and quackery, then it is time for the regular medical profession to withdraw its support from such organizations.

FEE splitting is a great game. As long as there are doctors who possess elastic or perhaps we ought to say no consciences, and the public does not interest itself in being stung, just so long will the iniquitous practice of fee dividing thrive. However, it is a little amusing to a rank outsider to note the howls of protest which go up from the old time fee dividers when they note that their "business" is slipping from them because rivals, usually younger and often without adequate training or experience, are getting the "business" because a larger commission is offered. Of course, the poor patients' best interests are not considered. In fact, the submissive patient with a mistaken notion concerning the solicitude of his family physician is led blindfolded and hobbled to the highest bidder, where he is made the object of the most mercenary transaction that it is possible to conceive. It is reported that one man has said: "I am going to get mine while the getting is good," but while all this is going on the medical profession as a whole is getting a black eye which it very justly merits. The innocent may suffer with the guilty, but at least they have the satisfaction of having a clear conscience, and we can not help but feel that even the grafters in the medical profession, in their own hearts, have very high respect for the men in the profession who are trying to be clean and honest.

PALMER, the high priest of chiropractic, is broadcasting by radio a talk on salesmanship as applied to chiropractic. It is a little amusing to hear him announce to chiropractors that their work is a business, and that it must be "sold" to the public by making everyone think that they can be benefited by chiropractic adjustments. On the other hand the public is told that the only way to get well is to seek chiropractic treatment, and the inference is drawn that every person can be made a little better by certain adjustments that only the chiropractor can give. Very naturally a lot

of people are going to take up with this "gold brick" proposition, and many will pay the penalty for being deluded by such specious argument, but the point of this incident is that the growth of the pseudo-medical cults and their popularity with the public is due entirely to such propaganda as is being spread broadcast by Palmer. What is the regular medical profession doing to offset this pernicous propaganda? It is quite true that the New York State Board of Health is doing a splendid work in giving daily and weekly health talks by radio, but there should be more such activity in every state in the union. In fact, the regular medical profession has a great educational work before it if the public is to be prevented from accepting such delusive information as is being put out through the propaganda of chiropractors and other pseudo medical cults.

THERE is something radically wrong in this country when the Standard Oil Company can declare a dividend of a hundred per cent and many other companies can declare dividends equal to or almost as large. Every corporation is entitled to a fair return upon money invested, and the return should provide for a reasonable surplus, but there is no excuse for such enormous profits. While we are thinking of profiteering and the evils resulting from trusts and combinations of capital let us not forget that some of the labor unions are limiting the number of apprentices in certain trades, and even in some instances barring the taking on of apprentices for periods of years, all with the idea of controlling the labor situation and forcing higher prices. Evidence has been produced to show that in New York City as well as in Chicago, plasterers have demanded and received wages and bonuses that netted the individual plasterer twenty-five to thirty dollars per day, with short hours for the day and no great amount of work accomplished during the day. It looks as though "all are doing it," though we haven't heard of any move on the part of the medical men to control the market for medical and surgical services, nor boosting the rates to a profiteering basis, and, worse than all, our government that we are called upon to bleed and die for if necessary, soaks the poor man, including the hard-working doctor whose earnings represent his individual effort, whereas big business and individuals having unearned income manage to escape to a very large extent. We do not believe in bolshevism, communism, or socialism, but we do believe that something should be done to equalize the burdens in this country.

TALK about Barnum humbugging the people and short change artists taking advantage of all who come their way, the chiropractors have both beaten a mile. The strange part of it is that supposedly reasonably intelligent people "fall" for such a humbug. Recently a young woman who had never worn glasses and needed appropriate lenses to correct a large error of refraction which was causing terrific headaches when the eyes were used for the close point, admitted that she had been treated by a chiropractor for several months in the belief that pain in the eyes was due to an impingement of nerves in the spinal column. A pair of glasses relieved her trouble, but the chiropractor capitalized his ignorance or knavery, or both, to the extent of over a hundred dollars, and the credulous patient pays the penalty. If these chiropractors had any knowledge of the fundamental branches of the science that deals with the human body in both health and disease, they would not be chiropractors. However, they do not have the time, ability or money to obtain such knowledge and they follow the alluring promises of the chiropractic leaders who frankly state that nothing more than a common school education and a few weeks training is necessary in order to become a chiropractor and that easy money awaits the one who begins chiropractic. The chiropractic leaders realize the force of Barnum's reputed statement that the public likes to be humbugged. The public certainly is humbugged when it takes up with chiropractic, for, generally speaking, there never was a more monumental fraud perpetrated upon the impressionable public, and the pity of it is that it is practiced upon the sick and suffering who deserve the best that can be obtained and, in their ignorance, should be protected by law.

THE Indiana legislature will be in session again next month. We shall be interested in knowing how many Indiana doctors are sufficiently interested in their own welfare to give any time or the slightest attention to the matter of legislation that will affect them. We venture to say that the chiropractors, the Christian Scientists, and the members of various other pseudo-medical cults have gone to considerable trouble to acquaint themselves with the attitude of the incoming legislators concerning subjects which directly or indirectly affect the practice of medicine or public health affairs. How many members of the Indiana State Medical Association have turned a hand in this direction? The time to do most of the work is before the legislature convenes and not wait until threatened legislation is about to pass the legislature and then leave it to a few men to frantically work to stem the

tide of adverse action. Why not get your coat off, Mr. Lazy Doctor, and do something? You are the fellow who will whine the loudest when the legislature passes something that interferes with your vocation and be detrimental to the welfare of the public as well. Pure selfishness and a desire to improve your economic and social position ought to impel you to get busy, even if you haven't the spirit in your heart to work for what you know to be right and just for your fellow men. Quackery of every description is harmful as well as dishonest, and there should be some means of curbing or suppressing it. You recognize this fact and yet you inwardly nurse the feeling that if you do not stir yourself someone else will, and thus the work that is of benefit to you will be done by someone else. That is the wrong attitude. Don't adopt the slogan, "Let George do it," but get busy yourself.

THERE is ample evidence to show that the Christian Scientists are hooked up with the pseudo-medical cults, the American League for Medical Freedom, the Anti-Vaccinationists, the Anti-Vivisectionists, and all the other sects and organizations that are fighting scientific medicine. The Christian Scientists and the chiropractors put up a strenuous fight to defeat Dr. J. N. Hurty from being elected to the Indiana legislature but they were unable to accomplish the desired result. These two cults, partners in efforts to retard progressive medicine, sent out circulars to the faithful, and to others thought to be susceptible, asking that Dr. Hurty be "swatted" at the polls. Verily, politics make queer bedfellows. However, organized medicine has received so many hard jolts as a result of just such work as done by the combination of chiropractors and the Christian Scientists that it is time for medical men to wake up to the realization that no matter how virtuous and just our cause, it requires political activity like that put forth by the chiropractors and the Christian Scientists to gain anything, and while Dr. Hurty won out, largely through his personal popularity, yet we have no reason to lie down on the job and conclude that we always are going to be so fortunate. Our advice to every doctor in Indiana is to get into politics, no matter whether such action is liked or not. By this we do not mean the rotten politics which some of our adversaries stoop to, nor do we mean partisian politics. We do mean the kind of politics which carries influence and education to the voters as well as to the candidates for office. If the medical men of Indiana would unite solidly in putting forth its influence for better legislation concerning medical and public health matters, there is nothing within reason that they could not secure.

"How to Increase Your Practice and Your Income" is the slogan adopted by some manufacturers of physician's equipment, especially those making devices for the use of electricity or mechano-therapy in the treatment of patients. Evidently some manufacturers are not only tinctured with the idea that for the most part doctors are gullible, but that they are also dishonest, for when soliciting the business of physicians the special plea is made that "few patients coming to the doctor's office are not benefited by daily treatments with electricity or some form of mechano-therapy, and think what that means at one to three dollars per treatment!" Could anything be more alluring? The doctor who "falls" for such "rot" certainly has an elastic conscience if he is not plainly dishonest from head to foot. In reality the doctors who take up with such a proposition deserve no more confidence than the chiropractors who use mechano-therapy for everything and usually stick to it until all the patient's money is gone or the patient becomes satisfied that no benefit is being secured. It is quite possible that many people will be willing to be humbugged by such chicanery, as is evidenced by the fact that a well-to-do family permitted a chiropractor to knead and pommel a child for nearly a year to cure the youngster of the effects of obstructed breathing from enlarged tonsils and an enormous bunch of adenoid tissue in the nasopharynx, and at the end of a year, and after an expenditure of several hundred dollars, the fond parents were told that "all you have to do is to continue the treatment for about six months longer and your child will be cured." What intelligent and conscientious doctor will take up with practices allied to those of the chiropractor and do it because he can increase his practice and his income?

ARTHUR BRISBANE, a well known writer, contributes a feature article every day to a syndicate of newspapers. These articles touch upon every conceivable topic and for the most part are very interesting and the comments pertinent. He has made a justifiable plea for people of all classes to consult a reputable physician when they are sick, and he takes a rap at the anti-vivisectionists and anti-vaccinationists by declaring that to animal experimentation we owe much of our definite knowledge concerning anatomy, physiology and the nature and cause of many diseases, and that we will have smallpox with all of its disastrous results as long as people fail to take advantage of vaccination as a preventive measure. He also has taken occasion to comment upon wonderful specific effects of antitoxin in the treatment of diphtheria, and to remind the public that as a

result of typhoid vaccination, typhoid was practically unknown in the last great war whereas in all previous wars it was one of the greatest scourges contended with. Recently he has mentioned the effect of a new remedy made from the pancreas of a pig which is reputed to be a cure for diabetes. He even goes so far as to recommend that if those who are suffering from diabetes can not obtain from their physicians the desired information concerning this new treatment, that application should be made to the superintendent of the New York hospital in New York city. While some may say that Mr. Brisbane is overenthusiastic in some of his opinions and contentions, yet the fact remains that he does appreciate the fact that all information and all recommendations should come from trustworthy sources and in this respect he recognizes that the reputable, educated and well trained scientists are the ones in whom to place dependence. Undoubtedly Mr. Brisbane, as a noted and popular writer, is doing much to educate the public concerning health problems, and we are very much pleased to note that up to this time he seems to have discussed these subjects in a consistent and rational way.

WHEN we analyze some of the uplift schemes and study the motive which prompts the chief uplifters to interest themselves in such schemes, we usually find that back of the whole enterprise is a personal ambition to be served, or some object which is entirely foreign to the altruistic spirit which the uplifters try to make out as the cause of the activity. This is evidenced by the large number of national societies that have the same or similar objects as a reason for their existence, all more or less at loggerheads, each and every one dominated by a few individuals aspiring for leadership and prominence, and very naturally each overlapping the work of some others. Even the get-rich-quick schemes are of minor importance as compared to various schemes for curing disease or promoting health. The trouble with most charitable and philanthropic organizations is that they do not distinguish between philanthropy and the practice of confiscation of professional service, and in nearly all of these uplift schemes which have to do with health or disease is the medical man who is called upon to donate his knowledge and services. These uplifters who apparently are so solicitous for the welfare of the human race seem to forget that a doctor's professional knowledge and service are just as much his stock in trade as the grocer's foodstuffs or the dry goods man's fabrics. People suffer from preventable diseases every day, of course, and those diseases ought to be prevented. People also suffer from lack of food and from lack of clothing, and those conditions ought to be relieved, but the most rabid philanthropist who does not hesitate to take a doctor's services without any compensation at all would never dream of going into a grocery store or dry goods store and helping himself or herself on the plea that people were hungry or naked. As one of our medical friends tersely puts it, "The doctor very foolishly has permitted himself to be put in a position where he is giving away the most valuable part of his knowledge and services, and he is trying to make a living on the rest which is constantly diminishing." Naturally he is beginning to feel the pressure and to squeal. Sometimes his resentment takes the form of objection to public health plans. This is unwise, because public health work in its true sense is going to go on and we can't stop it. What he should object to is the constant effort to promote public health plans at the expense of the profession and to insist that whenever professional services are furnished that they shall be paid for at a reasonable rate. The fact that this is service rendered to the public does not in any way justify the exploitation of the medical profession. Lawyers, of course, learned this centuries ago, and every legal service that a lawyer renders to the people, either as an individual or as an official, is well paid. Doctors had no services which they could render the people until present day public health knowledge developed, and they weren't wise enough on the start to insist upon proper compensation. There are two principles that should be adopted as slogans of the A. M. A. and every medical society in the country. The first is: "All medical work shall be done by medical men" and the second, "All medical work shall be adequately compensated."

DEATHS

WILLIAM Y. WELLS, M. D., died November 10, at his home in Laketon. He graduated from the Indiana Medical College, Indianapolis, in 1873.

T. B. RITTER, M. D., of Orleans, died October 27, aged 71 years. He was a member of the Orange County Medical Society and the Indiana State Medical Association.

WILLIAM H. BUTLER, M. D., died in Richmond, November 17. Dr. Butler graduated from the Medical College of Indiana, Indianapolis, in 1879, and was a member of the Bartholomew County Medical Society and the Indiana State Medical Association.

FRANK C. HESS, M. D., of Cadiz, died November 11, aged sixty-six years. Dr. Hess graduated from the Medical College of Ohio, Cincinnati, in 1881. He held membership in both the Henry County Medical Society and the Indiana State Medical Association.

JOSEPH L. PRESTON, M. D., of Cloverdale, died October 24, at the age of 71 years. He graduated from the Indiana Medical College, Indianapolis, in 1877. Dr. Preston was a member of the Putnam County Medical Society and the Indiana State Medical Association.

ALBERT MAY, M. D., of Crothersville, died November 10, at the age of seventy-six years. Dr. May graduated from the University of Louisville, Medical Department, in 1875. He was a member of the Jackson County Medical Society, and the Indiana State Medical Association.

JOHN N. RECORDS, M. D., died at his home at Franklin, Indiana, November 14, at the age of sixty years. Dr. Records graduated from the University of Louisville, Medical Department, in 1894, and was a member of the Johnson County Medical Society and the Indiana State Medical Association.

ROBERT E. MARSHALL, M. D., of Elwood, died at an Indianapolis hospital, November 5, following an operation, at the age of forty-seven years. Dr. Marshall graduated from the Central College of Physicians and Surgeons, Indianapolis, in 1903. He was a member of the Madison County Medical Society and the Indiana State Medical Association.

WARREN D. CALVIN, M. D., 55 years of age, died suddenly on December 6 at his home in Fort Wayne following an attack of angina pectoris. Dr. Calvin was born near Bryan, Ohio, in 1867. He received his medical education from Rush Medical College, Chicago, from which institution he graduated in 1895, locating in Fort Wayne two years later, where he has resided continuously since that time. Dr. Calvin served in the World War with the rank of captain. He was always active in local civic and medical affairs, and at the time of his death was councilor for the Twelfth District Medical Society. He was a member of the Fort Wayne Medical Society, Indiana State Medical Association, Mississippi Valley Medical Association, and American Medical Association.

NEWS NOTES AND PERSONALS

Anything in the line of physicians' supplies or equipment may be obtained from advertisers in THE JOURNAL OF THE INDIANA STATE MEDICAL ASSOCIATION. Patronize these advertisers, for it means a continuance of their advertising patronage, and the latter means a larger and better Journal for you.

DR. ELLA A. HOLLIS, of Hartford City, has gone to Santa Barbara, California, where she will spend the winter.

DR. OSCAR T. SCAMAHORN, of Pittsboro, was elected president of the Seventh District Medical Society at a meeting held in Indianapolis, November 2.

THE DeKalb County Medical Society held a meeting in Auburn November 2. A paper was presented by Dr. C. S. Stewart, the subject being "Deafness."

DR. WILLIAM G. SYMON and Miss Neva Klingler, both of Garrett, were married November 3 at Peru. Dr. Symon is a member of the clinic staff at Garrett.

THE Madison County Medical Society held a meeting at Anderson, November 21. Dr. Charles Moon, of Indianapolis, presented a paper on Social Diseases.

THE Shelby County Medical Society held a meeting at Shelbyville, November 15. A general discussion of cures for cancer formed the main part of the program.

DR. EUGENE L. BULSON of Fort Wayne has been spending the past two months in the east, where he has been doing post-graduate work in eye, ear, nose and throat.

INDIANA ranks tenth in the number of cancer deaths during 1921 in the various states, according to a chart prepared by the government to be used in the observance of Cancer Week.

THE Gibson County Medical Society held a meeting at Princeton, November 13. The program consisted of a general discussion of Bright's disease and meningitis.

THE Clinton County Medical Society held a meeting at Frankfort, November 2. Dr. A. G. Chittick presented a paper on the subject of "Advantages and Disadvantages of Group Practice."

DR. CHARLES P. EMERSON, of Indianapolis, was re-elected a member of the national committee for mental hygiene at the thirteenth annual meeting of the committee held recently in New York city.

WORK has been started on the erection of the Shrine Crippled Children's hospital at St. Louis. The hospital will consist of a three-story administration building, with two ward buildings, each two stories high, having room for eighty ward beds.

THE officers of the American College of Surgeons who were elected at the annual meeting are: President, Dr. Albert J. Ochsner, Chicago; First Vice-President, Dr. Lincoln Davis, Boston; Second Vice-President, Dr. John George McDougal, Halifax.

THE medical societies of DeKalb, Steuben, Lagrange and Noble counties met in a joint session at the Community building in Kendallville, November 23. Dr. Craig, of Chicago, delivered an address. Plans were made to organize under the name of the Northern Indiana Medical Society.

THE Wabash County Medical Society held a meeting November 16, at Wabash. A paper was presented by Dr. G. T. Biggerstaff on "Protective Social Measures in Specific Diseases," and a paper by Dr. G. M. LaSalle on "Relation of Infected Teeth to Other Infections" also was presented.

THE annual session of the Indiana Academy of Ophthalmology and Otolaryngology is to be held at Claypool Hotel, Indianapolis, Jan. 17 and 18, 1923. An interesting program has been prepared. Dr. D. O. Kearby, of Indianapolis, is president and Dr. Bernard J. Larkin, of Indianapolis, is secretary.

THE Laporte County Medical Society held a meeting at Michigan City, November 9. Dr. T. Howard Plank, of Chicago, presented a paper on "High Frequency Currents in Treating Malignancies." Dr. Frank J. Novak, of Chicago, presented a paper on "Surgical Diathermy and Its Possibilities."

THE Fifth District Medical Society held a meeting November 14 at Terre Haute. The following officers were elected: Dr. J. F. Smith, Brazil, president; Dr. A. E. Rhein, Rosedale, vice-president, and Dr. Charles Wyeth, Terre Haute, secretary. Dr. William A. Jenkins, of Louisville, presented a paper.

THE following places in Indiana are without physicians at the present time: Liberty Center, Wells county; Dunreith, Hancock county; Mays, Rush county; Bippus, Huntington county, has one who wants to get away; Inwood, Marshall county; Ame and Stilesville, Hendricks county; Needham, Johnson county, has one, but another is desired, and Milhausen, Decatur county.

THE militia bureau of the War Department has allotted to Indiana the organization of a medical supply section, a medical laboratory section and a headquarters medical regiment, all to be units of the 113th medical regiment. With the exception of two hospital companies, all of the units of the regiment will be in Indiana. Headquarters of the regiment probably will be in Indianapolis.

THE St. Louis (Missouri) Medical Society has purchased ground on Lindell Boulevard adjoining Moolah Temple, where the commercial exhibits and registration bureau were located during the recent session of the American Medical Association. The ground, 150 feet square, was purchased at a cost of $22,500; this sum has been contributed by forty-five members, each paying $500.

THE Thirteenth Annual Meeting and Luncheon of the National Committee for Mental Hygiene was held at the Pennsylvania Hotel, New York City, on November 9th. Addresses were made by Dr. Haven Emerson, Professor Stephen P. Duggan and Mr. John J. Carty, of New York, Professor Elton Mayo, of the University of Queensland, Australia, and Dr. F. N. Williams, Medical Director of the National Committee.

THE National Board of Medical Examiners announces the following dates for its next examinations: Part I, February 12, 13 and 14, 1923; Part II, February 15 and 16, 1923. The fees for these examinations have been continued at the reduced rate for another year. Applications for these examinations must be forwarded not later than January 1, 1923. Application blanks and circulars of information may be obtained from the Secretary of the National Board, Dr. J. S. Rodman, Medical Arts Building, Philadelphia, Pa.

DURING November, the following articles have been accepted by the Council on Pharmacy and Chemistry for inclusion in New and Nonofficial Remedies: Lederle Antitoxin Laboratories, Mercurialized Serum-Lederle for Intravenous Use; Charles Leich & Company, Sulfarsenol; Mallinckrodt Chemical Works, Barium Sulphate Pure-M. C. W.; H. A. Metz Laboratories, Benzosol; Parke, Davis & Company, Silvol. Arsenobenzol (Dermatological Research Laboratories) and Arsphenamine (Dermatological Research Laboratories): These products are now marketed by the Abbott Laboratories

as Neoarsphenamine-D. R. L. and Arsphenamine-D. R. L. The Council has continued the acceptance for New and Nonofficial Remedies under these names.

THE medical profession will be interested in the announcement that the Abbott Laboratories of Chicago have purchased the Dermatological Research Laboratories of Philadelphia.

It will be remembered the Dermatological Research Laboratories were the first in the United States to produce Arsphenamine during the war when there was such a scarcity of this article; and these laboratories became well known to the medical profession for their patriotic attitude in developing and manufacturing medicinal preparations in this country. By this purchase of the "DRI" products, the Abbott Laboratories inherited their prestige.

The Abbott Laboratories acquired control of the Dermatological Research Laboratories on November 1st; and are continuing to operate them in Philadelphia under the direction of Dr. Geo. W. Raiziss, head of the department of chemistry, and his corps of specially trained assistants. Orders for "DRI" products will be promptly filled from the Philadelphia Laboratories or from their branches or distributors.

DURING the year 1921 the Rockefeller Foundation continued a quarter-million annual appropriation to the School of Hygiene and Public Health, of Johns Hopkins University; pledged two million to Harvard for a school of health; contributed to public health training in Czecho-Slovakia, Brazil, and the United States; aided the Pasteur Institute of Paris to recruit and train personnel; promoted the cause of nurse training in America and Europe; underwrote an experimental pay clinic in the Cornell Medical School; formally opened a complete modern medical school and hospital in Pekin; assisted twenty-five other medical centers in China; promised a million dollars for the medical school of Columbia University; contracted to appropriate three and one-half millions for the rebuilding and reorganization of the medical school and hospital of the Free University of Brussels; made surveys of medical schools in Japan, China, the Philippines, Indo-China, Straits Settlements, Siam, India, Syria and Turkey; supplied American and British medical journals to 112 medical libraries on the continent; supplemented the laboratory equipment and supplies of five medical schools in Central Europe; defrayed the expenses of commissions from Great Britain, Belgium, Serbia and Brazil; provided 157 fellowships in hygiene, medicine, physics and chemistry, to representatives of eighteen countries; continued a campaign against yellow fever in Mexico, Central and South America; prosecuted demonstrations in the control of malaria in ten states; co-operated in hookworm work in nineteen governmental areas; participated in rural health demonstrations in seventy-seven American counties and in Brazil, neared the goal of transferring to French agencies an anti-tuberculosis organization in France; provided experts in medical education and public health for counsel and surveys in many parts of the world, and rendered sundry minor services to governments and voluntary societies. These were done in part by the Foundation directly, but chiefly through its departmental agencies—the International Health Board, the China Medical Board, and the Division of Medical Education.

MUNCIE ACADEMY OF MEDICINE

The regular meeting of the Muncie Academy of Medicine was held in the Roberts Hotel, Friday evening, November 17th.

Dr. E. R. Hiatt, of Pennville, read a paper dealing with "Medical Ethics and the Laity". He said in part:

My plea is for an honorable and far-reaching system of propaganda for reform in the relation of doctor and patient.

We are now feeling the pressure of an agitation for further requirements for the surgeon and other specialists. Such requirements are fitting and proper, but I feel that the practical application of medical science to our population as patients has not kept pace with the advance of medical standards required for the physician. Instead of constantly thinking up additional requirements and restrictions for him, why not make more effort to lead the public to appreciate the meaning of these requirements and to give due respect to their fulfillment?

University graduates and persons otherwise intelligent fall for the medical quack and the chiropractor. Many men of pleasing personality, with meager medical training and void of conscience, have become "successful" physicians, and by their humbuggery, inuendos or perhaps a mere shrug of the shoulder or facial expression when the opportunity presents itself, may influence his patrons, who seldom can gauge the ability and skill of the physician, against the trained and honest practitioner. Many times the renegade member of the profession is more of a menace than the blatant quack or pretender who may be a specialist in diseases of the skin and all of its contents.

Simple facts concerning epidemiology and hygiene should be understood by the public so there would be no excuse for them to fluctuate between the diversity of opinions preached by cults and faddists. No

matter how silly some of these opinions may appear to us, the laity is seldom competent to judge between fact and fiction, neither are they able to distinguish the good doctor from the bad. Many dishonest physicians are careful to meet all their financial obligations promptly and maintain a reputation for honest dealing, yet are grossly unscrupulous when the good name of their fellow physician is at stake.

I believe the public should have real education along the lines of ethics, general aims of the medical profession, public health matters, the fallacy of the quack cults, and a course of study enabling them to recognize a well trained physician.

My idea would be to have a central committee, preferably appointed by the A. M. A., prepare bulletins once a month at least, for distribution to local medical societies all over the United States, in quantities that the individual societies may deem wise to order. A mailing list could be compiled and a copy of the bulletin sent to every family. The subject matter could be carried by the local newspapers, as paid advertising if necessary. The cost of the work done by the central committee could be borne by the national society.

This would prove a powerful influence toward elevating the standards as well as the standing of the medical profession. H. D. FAIR.

TRUTH ABOUT MEDICINES

NEW AND NONOFFICIAL REMEDIES

TETANUS ANTITOXIN, PURIFIED.—A tetanus antitoxin, concentrated (New and Nonofficial Remedies, 1922, p. 281), that is also marketed in syringe containers of 10,000 units. E. R. Squibb & Sons, New York.

STAPHYLOCOCCUS VACCINE.—This product (New and Nonofficial Remedies, 1922, p. 306) is marketed in packages of four syringes containing, respectively, 100, 250, 500 and 1,000 million killed Staphylococcus aureus and Staphylococcus albus in equal proportion; in packages of four ampules containing, respectively, 100, 250, 500 and 1,000 million killed staphylococcus aureus and albus in equal proportion (with a syringe); and in vials of 5 Cc., 10 Cc., and 20 Cc., each cubic centimeter containing 5,000 million killed Staphylococcus aureus and Staphylococcus albus in equal proportion. E. R. Squibb & Sons, New York.

STREPTOCOCCUS VACCINE.—This product (New and Nonofficial Remedies, 1922, p. 308) is marketed in packages of four syringes containing, respectively, 100, 250, 500 and 1,000 million killed streptococci; in packages of four ampules containing, respectively, 100, 250, 500 and 1,000 million killed streptococci (with a syringe) and in vials of 5 Cc., 10 Cc. and 20 Cc., each cubic centimeter containing 1,000 million killed streptococci. E. R. Squibb & Sons, New York.

TYPHOID VACCINE.—This product (New and Nonofficial Remedies, 1922, p. 310) is marketed in packages of four syringes containing, respectively, 100, 250, 500 and 1,000 million killed typhoid bacilli; in packages of four ampules containing, respectively, 100, 250, 500 and 1,000 million killed typhoid bacilli (with a syringe); and in vials of 5 Cc., 10 Cc. and 20 Cc., each cubic centimeter containing 1,000 million killed typhoid bacilli. E. R. Squibb & Sons, New York.

TYPHOID VACCINE COMBINED, IMMUNIZING.—A typhoid vaccine (New and Nonofficial Remedies, 1922, p. 310) that is marketed in packages of three syringes, one containing 500 million killed typhoid bacilli and 375 million each of killed paratyphoid A and paratyphoid B bacilli, and each of the other two syringes containing 1,000 million killed typhoid bacilli and 750 million each of killed paratyphoid A and paratyphoid B bacilli; in packages of three ampules containing, respectively, the same dosages as the three-syringe package (with a syringe); in packages of 30 ampules, hospital size; and in vials of 5 Cc., 10 Cc. and 20 Cc., each cubic centimeter containing 2,500 million killed bacilli. E. R. Squibb & Sons, New York.

STAPHYLO-ACNE VACCINE.—A mixed bacterial vaccine (New and Nonofficial Remedies, 1922, p. 314) that is marketed in packages of four syringes, the first containing a mixture of 50 million each of killed staphylococcus albus, or killed staphylococcus aureus and of killed acne bacilli, the second containing a mixture of 125 million each of killed staphylococcus albus, of killed staphylococcus aureus and of killed acne bacilli, the third containing a mixture of 250 million each of killed staphylococcus albus, of killed staphylococcus aureus and killed acne bacilli, the fourth containing 500 million each of killed staphylococcus albus, of killed staphylococcus aureus and of killed acne bacilli; in packages of four ampules containing the same dosages as the four-syringe package (with a syringe); and in vials of 5 Cc., 10 Cc. and 20 Cc., each cubic centimeter containing 1,500 million killed bacteria. E. R. Squibb & Sons, New York.

COLON VACCINE.—A colon bacillus vaccine (New and Nonofficial Remedies, 1922, p. 299) that is marketed in packages of four syringes containing, respectively, 100, 250, 500 and 1,000 million killed bacilli; in packages of four ampules containing, respectively, 100, 250, 500 and 1,000 million killed bacilli (with a syringe); and in vials of 5 Cc., 10 Cc. and 20 Cc., each cubic centimeter containing 5,000 million killed bacilli. E. R. Squibb & Sons, New York.—(*Jour. A. M. A.*, Nov. 4, 1922, p. 1609).

BARIUM SULPHATE PURE-M. C. W.—A brand of barium sulphate for roentgen-ray work-N. N. R. (see New and Nonofficial Remedies, 1922, p. 62). Mallinckrodt Chemical Works, St. Louis.

BENZOSOL.—A brand of guaiacol benzoate-N. N. R. (New and Nonofficial Remedies, 1922, p. 92). H. A. Metz Laboratories, Inc., New York.

NORMAL HORSE SERUM-P. D. & Co.—This product (New and Nonofficial Remedies, 1922, p. 278) is marketed in packages containing one 10 Cc. syringe container (Bio. 50); in packages containing one 10 Cc. rubber stoppered bulb (Bio. 52), and in packages containing one 30 Cc. rubber-stoppered bulb (Bio. 53). Parke, Davis & Co., Detroit.

RABIES VACCINE (CUMMING).—An antirabic vaccine (New and Nonofficial Remedies, 1922, p. 290). The virus is prepared by dialyzing a 1 percent suspension of brain tissues (from a rabbit dying of rabies induced by an injection of fixed virus) against running distilled water until the active virulent virus is destroyed. The treatment is divided into two classes: Mild, requiring 14 doses; severe, requiring 21 doses. One dose, 2 Cc., is given daily over a period of either 14 or 21 days. Each package (Bio. 440) consists of seven syringe containers of 2 Cc. each (1 dose). Parke, Davis & Co., Detroit.

SULFARSENOL.—SULPHARSPHENAMINE.—Chemically, sulfarsenol is closely related to neoarsphenamine. It contains from 18 to 20 percent of arsenic. The arnesic content of three parts of sulfarsenol is approximately equal to two parts of arsphenamine. The actions, uses and dosage are essentially the same as neoarsphenamine, but it is claimed to have the advantage over neoarsphenamine in that its solutions are more stable and in that it may be administered subcutaneously. Sulfarsenol is marketed in ampules containing, respectively, 0.06 Gm., 0.12 Gm., 0.18 Gm., 0.24 Gm., 0.30 Gm., 0.36 Gm., 0.42 Gm., 0.48 Gm., 0.54 Gm., 0.60 Gm. Chas. Leich & Co., Evansville, Ind.—(*Jour. A. M. A.*, Nov. 18, 1922, p. 1767).

PROPAGANDA FOR REFORM

ABRAM'S "OSCILLOCLAST".—This is a piece of electrical apparatus which is said to produce vibrations of varying rate. Its use is based on Abram's theory that "specific drugs possess a like vibratory rate as the diseases for which they are effective". Instead of using a drug one starts the "Oscilloclast" going, moves the indicators to the number corresponding to the vibration rate of the indicated drug and applies the instrument to the sufferer who, it is alleged, then gets the therapeutic action of the drug in question. The "Oscilloclast" is not for sale. It may be leased (for about two hundred dollars) on signing a contract that the instrument will not be opened. Within the past few months Abrams has been making bids for osteopathic patronage. The followers of the cult have not been slow to respond. The lure of the dollar and the bizarre is irresistible. Many of the lessees of the "Oscilloclast" are individuals who for years have lived in what may be called the twilight zone of professionalism where it is difficult to distinguish between the visionary with a fad and the quack or near-quack with a scheme.—(*Jour. A. M. A.*, Nov. 4, 1922, p. 1626).

CAROID.—This is a preparation of papain (obtained from papaya). Caroid was first marketed by the American Ferment Co. and later by Mead, Johnson & Co. For a considerable time the Council on Pharmacy and Chemistry had Caroid under consideration and in the end rejected the product on account of its variability. Although Caroid was found more active than other preparations of papain, examination showed that the claims for its digestive efficiency were exaggerated. Since the publication of the Council's report in 1914, Mead, Johnson & Co. do not seem to have made any propaganda for Caroid. It is now being promoted by the American Ferment Co., but this firm has not requested a consideration of the product by the Council.—(*Jour. A. M. A.*, Nov. 4, 1922, p. 1629).

THE A. M. A. CHEMICAL LABORATORY.—When, some seventeen years ago, the Council on Pharmacy and Chemistry began its work of turning the light on proprietary medicines its main concern was to let physicians know the composition of many of the proprietary medicines widely advertised in medical journals. At that time the exposure of false or vague and meaningless declarations of identity was considered of basic importance. This fact is shown by the name of the Council and by the appointment at that time of many chemists and pharmacists as members of the Council. This need for work which should bring home to the medical profession the essential secrecy of the drug preparations which they were asked to prescribe lead also to the establishment of the A. M. A. Chemical Laboratory. The initial reports of the Council gave the medical profession the first definite statement of many proprietaries then advertised extensively. Though many of these proprietaries were offered to the profession as new chemical discoveries, they were, in fact, simple mixtures of well known chemicals and their analysis presented little difficulty. As the result of this work of the Council and the Laboratory most promoters of pharmaceutical specialties know better than to invest money in the exploitation of mixtures the sale of which would be interfered with when there is a disclosure of its composition. But this does not mean that today the composition of all proprietaries is correctly declared. Proprietaries are still to be found which sail under false colors as to their composition.

The work of the Chemical Laboratory, however, has become more difficult. Instead of analyses of mixtures, the Laboratory has to do with new compounds of novel composition which do not have the chemical composition or chemical constitution ascribed to them. A report of the Council on Pharmacy and Chemistry of Galyl is an example of the more difficult work now required of the Laboratory. The Laboratory investigated the product and reached the conclusion that its administration amounted to the giving of arsphenamin (in the form of the sodium compound) with extraneous inorganic material, and thus obviated the need of comparative clinical trials of Galyl with arsphenamin.—(*Jour. A. M. A.*, Nov. 11, 1922, p. 1690).

BARIUM SULPHATE FOR ROENTGEN-RAY WORK.—A manufacturer of barium sulphate for Roentgen-ray work reported to the Council on Pharmacy and Chemistry that, though its product is free from objectionable impurities and equal to that of other brands on the market, it was confronted with the difficulty that its product, when tested by the standards of New and Nonofficial Remedies, appeared to contain acid-soluble barium salts. It urged that the phosphate test be omitted in that it showed a noticeable phosphate reaction when barium phosphate is totally absent but when a non-poisonous and unobjectionable phosphate (such as calcium phosphate) was present. The manufacturer submitted the tests which he employed, which also included a test for the fineness (fluffiness) of the product.

The A. M. A. Chemical Laboratory deemed the objection to the phosphate test well founded and the proposed revision of the test for soluble barium and the "fluffiness" test worthy of consideration. The laboratory submitted the suggested tests to the firms whose brands of barium sulphate stood accepted for New and Nonofficial Remedies and also to a group of users of barium sulphate. In general the manufacturers agreed to the proposed new tests. Many of the users of barium sulphate held, however, that extreme fineness was not essential. Several objected to the high price charged for some of the very finely divided products. In consideration of the available evidence, the Laboratory recommended to the Council that the "fluffiness" test be not adopted, that the phosphate test be omitted and recommended in its place a test which will require reasonable freedom from foreign salts along with tests which shall guarantee freedom from water and acid soluble barium salts and freedom from heavy metallic salts. The Council agreed to the recommendation of the Laboratory and directed that the recommended revision of the tests be adopted for New and Nonofficial Remedies, 1923.—(*Jour. A. M. A.*, Nov. 11, 1922, p. 1687).

GALYL.—In 1918 Geo. J. Wallau, Inc., acting as U. S. distributor for Galyl (manufactured by A. Naline, Garenne, France), requested the Council on Pharmacy and Chemistry to consider the product. At that time Galyl was stated to be a compound made up of two arsphenamin molecules linked by means of two phosphorus groups. The product was insoluble in water and for use had to be dissolved in sodium carbonate. It was claimed to be less toxic than arsphenamin, quicker of action on spirilla and of equal therapeutic value. Later the composition of Galyl was changed. The "new" Galyl was stated to be a sodium salt of the "old" Galyl. The A. M. A. Chemical Laboratory investigated the new Galyl and concluded that, if the compound has the composition claimed for it, it is easily decomposed; that when prepared for administration either it is partly decomposed into sodium phosphate and sodium arsphenamin or else the original product contains sodium arsphenamin and free phosphate. In either case, injection will probably amount to the administration of phospharsphenamin (if any is present), sodium arsphenamin, sodium phosphate, sodium sulphite and sugar. In December, 1921, the Laboratory report was sent to the agent and by him transmitted to the French manufacturer. No evidence was received to controvert the findings of the Laboratory that Galyl does not have the composition claimed for it. On the other hand, the findings have been supported by independent investigators. Accordingly

the Council declared Galyl inadmissible to New and Nonofficial Remedies because the evidence indicated that it does not have the composition claimed for it; because the therapeutic claims are unwarranted; and because its use under another name than sodium arsphenamine with deceptive claims for its composition is irrational and a detriment to rational therapy.—(*Jour. A. M. A.*, Nov. 11, p. 1706).

HABITUAL USE OF BARBITAL.—The constant use of even small doses of barbital (veronal) affects the central nervous system. Those taking the drug habitually become much debilitated and seem less able to stand moderate doses. Death has occurred from a 3 gm. dose in addicts. In Great Britain barbital (veronal) has been classified as a poison. Many cases of poisoning occur from its indiscriminate use by the laity.—(*Jour. A. M. A.*, Nov. 11, 1922, p. 1709).

"PATENT MEDICINE" SECRECY.—For years the medical profession has insisted that the real reason that nostrum makers keep the composition of their products secret is (1) for the glamour that such secrecy throws around them, and (2) the fact that so long as the public does not know what is in a preparation the advertiser's imagination is given freer play. The "Patent Medicine" makers, on the other hand, have maintained that their reason for keeping the composition of their products secret is that the formula is personal property and, if made known, the market would be flooded with imitations. Recently, however, *Standard Remedies*, the mouthpiece of the "patent medicine" interests, has admitted that the medical profession was right and the "patent medicine" makers wrong. It stated editorially: "It should be remembered that while a developed formula has a great value, it is the trade name, the advertising, the merchandising skill applied in connection with it that creates its valuable good will. Ten to one a thorough search through books of formulæ will reveal that your own is already known to the medical world. But no one can get the same benefit from it that you have gained unless they spend in merchandising it the same money that you have spent."—(*Jour. A. M. A.*, Nov. 11, 1922, p. 1692).

APROTEIN AND APROTINE NOT ADMITTED TO N. N. R.—Aprotein and Aprotine are casein preparations marketed as "the foremost tissue and body builders" by the John Norton Co., Columbus, Ohio. Aprotein (formerly designated Aprotein No. 2 Granulated Food Casein) is described in the advertising issued by the John Norton Co. (formerly the Diaprotein Co.) as a "scientifically, specially prepared granulated casein precipitated from fresh skimmed milk, concentrated to a high degree". The Council declared Aprotein inadmissible to New and Nonofficial Remedies because (1) its composition does not agree with a good dietetic casein and was not found to have the composition claimed for it, and (2) it is not only irrational but also a hindrance to therapeutics to market a well known substance like casein under a fanciful name. Aprotine, in the information sent the Council, is designated "a sodium calcium caseinate derivative" prepared by precipitating an acid calcium caseinate from skimmed milk by the addition of acid, washing the precipitate, mixing it with sodium bicarbonate and drying. A comparison of the analyses furnished the Council suggests that Aprotine and Aprotein are the same. The advertising claims suggest that Aprotine has therapeutic properties, whereas its effects will not differ from those of cottage cheese. The Council on Pharmacy and Chemistry declared Aprotine inadmissible to New and Nonofficial Remedies because (1) the statements made in regard to its composition are indefinite and misleading, (2) the therapeutic claims are unwarranted, and (3) there is no evidence to indicate that this casein preparation presents an improvement over casein-N. N. R.—(*Jour. A. M. A.*, Nov. 18, 1922, p. 1786).

THE PITUITARY HORMONE.—So far the active principle of the pituitary gland has not been isolated. It is possible that the pituitary contains more than one physiologically potent constituent. Perhaps both pressor and depressor compounds are derivable from the gland structures. Abel and Rhuiller have prepared products from the infundibulum which have both vasomotor and oxytocic effects. These investigators believe that if the product is obtained in the pure state, it will be fifty times more active than histamin, and that there is but a single specific hormone in the infundibulum, and that this has both vasomotor and uterus-stimulating properties as well as a powerful effect on the kidneys. The hope of a speedy isolation of this pituitary hormone as a chemical entity is somewhat shattered by the fact that it is unstable in laboratory manipulations.—(*Jour. A. M. A.*, Nov. 18, 1922, p. 1770).

ADAMS' WONDER CAPSULES.—In newspaper advertisements women and girls are urged to call at some local drug store and talk about their ailents with a kind, motherly woman of the experience and sympathetic understanding of Mrs. Gene Case. This noted "health advocate" recommends Adams' Wonder Capsules for girls and women who are "troubled with periodical pains", cramps and headache at menstrual time or who have neuritis, neuralgia, stomach, bowel or bladder pain * * *" The A. M. A. Chemical Laboratory examined Adams' Wonder Capsules and found that the capsules contained the recently introduced drug, benzyl succinate.—(*Jour. A. M. A.*, Nov. 25, 1922, p. 1876).

BI-OXO-DYN NOT ADMITTED TO N. N. R.—Bi-Oxo-Dyn is put out by "Bi-Oxo-Dyn", Savannah, Ga., according to the information furnished the Council on Pharmacy and Chemistry by W. F. Kennedy, Jr., who states that he is the maker and originator of the product. It is to be inferred that Bi-Oxo-Dyn contains 2 percent of free (elementary) iodin and 0.1 percent of hydrastin, 3 percent of chloral hydrate, 14 percent of bismuth hydroxide, 1 percent of menthol in a petrolatum base, and from 0.5 to 1.0 percent of a compound of succinyl peroxid and boric acid. However, the A. M. A. Chemical Laboratory reported that Bi-Oxo-Dyn contains no free iodin, but that it contains combined iodin in the form of iodid ions and that the presence of hydrogen peroxid or other peroxids could be demonstrated. The claim is made that Bi-Oxo-Dyn is of inestimable value for injection into the urethra and it is recommended in specific urethritis, uterine hemorrhage and painful chordee.

The Council declared Bi-Oxo-Dyn inadmissible to New and Nonofficial Remedies because (1) the statements of its composition are indefinite, misleading and incorrect, (2) the therapeutic claims are unwarranted, (3) the name is not descriptive of the composition of the product, and (4) Bi-Oxo-Dyn is a complex irrational mixture the marketing of which is detrimental alike to the interests of the public and of scientific medicine.—(*Jour. A. M. A.*, Nov. 25, 1922, p. 1867).

COMMERCIAL VITAMIN PREPARATIONS.—No student of the subject of vitamins can fail to recognize the ridiculousness of recent attempts to supply alleged vitamin-bearing preparations as cure-alls. It is doubtful if any latent, not to say evident, avitaminosis is prevalent in this country. Nevertheless, preparations sold to supply this alleged need of vitamins should at least not be fraudulent. E. P. Bailey of the Connecticut Experiment Station has determined the potency of some commercial vitamin preparations as compared with that of dried brewers' yeast. The report stated that apparently many manufacturers are not convinced of the efficiency of their vitamin preparations and, therefore, have added various medicaments of established reputation in therapeutics

for good measure and to ensure a reaction of some description. Bailey compared the potency of the products on the reasonable assumption that a preparation which in a 100 mg. dose does not exhibit the potency shown by 100 mg. of a good grade of dry brewers' yeast employed under comparable conditions does not justify a claim of superior therapeutic value as a source of water-soluble B vitamin. On this basis, nearly half of the advertised products failed. Others showed only inferior content of vitamin. A few of the products equaled good brewery yeast in potency and only two or three products among nearly two dozen examined showed any superiority of "concentration" over ordinary yeast.—(*Jour. A. M. A.*, Nov. 25, 1922, p. 1846).

THE "PROPAGANDA FOR REFORM" IN GERMANY.—An effort to establish a German Council on Pharmacy and Chemistry was made in Germany before the war. In spite of the demoralizing effects of the war, efforts are again being made in Germany toward the establishment of such a council. A commission of the Aerztevereinsbund, including such well-known men as Professor Heffter, Klemperer, Lenhoff and Schwalbe, has issued an appeal directed particularly against the misleading or fraudulent advertising still so common in many medical journals.

To acquaint the German medical profession with the method of the A. M. A. Council on Pharmacy and Chemistry and the changes that have been brought about in the Unietd States, the Deutsche Medizinische Wochenschrift of which Dr. Schwalbe is editor recently published a lengthy article that detailed the organization, aims and objects and accomplishments of the Council.—(*Jour. A. M. A.*, Nov. 25, 1922, p. 1848).

BOOK REVIEWS

RADIUM THERAPY. By Frank Edward Simpson, A.B., M.D., Professor of Dermatology, Chicago Polyclinic; Adjunct Clinical Professor of Dermatology, Northwestern University Medical School, etc. 166 original engravings; cloth, 392 pages. Price $7.00. C. V. Mosby Company, publishers. St. Louis, 1922.

At present there is a widespread interest in radium therapy. It is possible that radium as a therapeutic agent has fallen into disrepute in some quarters as a direct result of the unjustifiable enthusiasm on the part of some physicians, as well as through the employment of radium by those who put forth neither the time nor the effort required to study the effects of radium, the proper mode of application, and its good as well as ill effects. That radium therapy has a field of usefulness in a variety of affections is unquestioned, and in certain pathological conditions the results brought about by radium therapy are almost miraculous. However, radium is impotent as well as dangerous except when used judiciously and with intelligence. Therefore, in view of the widespread interest in the subject, this book by an authority should be welcomed by the medical profession and ought to have a large sale. The essayist discusses radium from every angle, including origin and chemical nature, physical, chemical and biological effects of the rays, dosage, technic, and the therapeutic uses in general surgery, gynecology, dermatology, ophthalmology, otology, and laryngology, diseases of the ductless glands and in internal medicine. The book is made more interesting by case histories and a very large number of original illustrations. The injurious effects of radium also come in for intelligent discussion, and the book closes with a very comprehensive bibliography. Throughout the entire work the author discusses the subject intelligently and temperately.

HYGIENE, DENTAL AND GENERAL. By Clair Elsmere Turner, Assistant Professor of Biology and Public Health in the Massachusetts Institute of Technology; Assistant Professor of Hygiene in the Tufts College Medical and Dental Schools. With chapters on Dental Hygiene and Oral Prophylaxis by William Rice, Dean, Tufts College Dental School. Cloth, pp. 400. Price $4.00. C. V. Mosby Company, St. Louis, 1920.

Multum in parvo is an expression that may be applied most appropriately to this excellent little work on hygiene. Not only is the book of value to the dentist, but equally so to the doctor and indeed there is so much information on personal hygiene contained in it that even the layman would needs be intensely interested in it. A surprising amount of ground is covered and the information is of the most accurate and practical kind.

THE SYMPTOMATIC TREATMENT OF GONORRHEA IN THE MALE. By Norman Lumb, O.B.E. Late R.A.M.C. Specialist in Venereal Diseases, and Officer-in-Charge of Division, 39 and 51 General Hospitals, B.E.F.; Clinical Assistant, St. Peter's Hospital for Stone. Second Edition. Cloth, pp. 123. Price $1.75. Lea & Febiger, Philadelphia, 1920.

The little volume offers a remarkably concise resumé of the subject of gonorrhea and its treatment from a modern standpoint. The newer methods of cultivation and the complement fixation test are featured as earlier diagnostic agencies and considerable enthusiasm is displayed by the author in the therapeutic use of vaccines, even in the very acute stage.

THE PRACTICAL MEDICINE SERIES. Volume 2 General Surgery. Edited by Albert J. Ochsner, M.D., F.R.M.S., L.L.D., F.A.C.S., Surgeon-in-Chief Augustana and St. Mary's of Nazareth Hospitals; Professor of Surgery Medical Department, University of Illinois, Series 1920, Chicago. The Year Book Publishers. Cloth, pp. 620. Price $3.50.

Although there is an unpleasant abbreviation of words in this volume, the text throughout is comprehensive and interesting. While that part devoted to abdominal surgery is more extensive yet much that is worth while in goitre and other thoracic surgery is reviewed.

One cannot refrain from calling attention to the simple method of citrate transfusion by means of an Erlenmeyer flask, as devised by Farr and Gilroy.

All told the volume this year is very complete and satisfying.

SHORT TALKS ON PERSONAL AND COMMUNITY HEALTH. By Louis Lehrfeld, A.M.M.D., Agent for the Prevention of Disease, Department of Public Health, Philadelphia. With Introduction by Wilmer Krusen, M.D., L.L.D. Director Department Public Health and Charities, Philadelphia. Cloth, pp. 271. Price $2.00. F. A. Davis Company, Philadelphia, 1920.

The problem of community health today is more than ever, one of prevention rather than cure of disease. Hency any agent that will aid in the education of the public along the lines of the prevention of disease will prove an asset to both laity and medical profession. This short, concise series of health talks should prove invaluable in spreading the gospel of disease-prevention and public health through schools, industrial plants, community meetings, social service agencies, churches or what not. Indeed it would be a most valuable addition to the library of any home, professional or otherwise.

MATERNITAS—A Book Concerning the Care of the Prospective Mother and Her Child. By Charles E. Paddock, M.D., Professor of Obstetrics, Chicago Post-Graduate Medical School; Assistant Professor of Obstetrics, Rush Medical College; Attending Obstetrician St. Luke's Hospital. Cloth, pp. 210. Price $1.75. Published by Cloyd J. Head & Co., Chicago, Illinois.

A truly satisfying little work is here presented that should prove most useful to the prospective and new mothers. One of its chief charms is the rare good common sense offered in answer to many of the time-honored superstitions with which the expectant mother is burdened by over-solicitous friends. This third edition has been carefully revised and much new material, as well as drawings, added.

THE RADIOGRAPHY OF THE CHEST. Volume 1. Pulmonary Tuberculosis. With nine line diagrams and ninety-nine radiograms. By Walker Overend, M.A., M.D. (Oxon), B.Sc. (Lon.), Hon. Radiologist and Physician to the Electrotherapeutic Department, East Sussex Hospital (Hastings); Radiologist to the City of London Hospital for Disease of the Chest (during the War); etc. St. Louis, C. V. Mosby Company, 1920. Cloth, pp. 119. Price $5.00.

At an age when conquest over tuberculosis has resolved itself largely into a question of early diagnosis that agent is most welcome which aids materially in the elucidation of the earliest positive findings. The time has come when no medical man desires to wait for the sputum to show tubercle bacilli before making a diagnosis for it is only the fortunate few whose lesions are sufficiently close to a bronchus as to discharge them in the sputum early in the disease. Nor is the indiscriminate use of tuberculin diagnostically to be encouraged for it is quite possible at times to produce untoward effects thereby.

If then we are able to correlate all the clinical data with carefully interpreted x-ray findings, realizing the pitfalls and possible shortcomings of each, we are then rendering our patient the most conservative service possible. For such purposes this work is admirably adapted, being illustrated as it is by a profusion of most instructive skiagrams. While all x-ray negatives lose materially in detail and diagnostic value in print reproduction yet sufficient remains to warrant the appearance of such a book as this one.

The author repeats what has been argued many times, viz., that the greatest accuracy in the diagnosis of pulmonary tuberculosis can only come by the combined study of the history, symptomatology, physical and laboratory findings and the x-ray data.

THE PROPAGANDA FOR REFORM IN PROPRIETARY MEDICINES, Vol. 2, 1922. Containing Reports of the Council on Pharmacy and Chemistry and Contributions from the A. M. A. Chemical Laboratory and from *The Journal of the American Medical Association*. Cloth. Price, $2.00. Pp. 603 with illustrations. Chicago: American Medical Association, 1922.

The present book is the second volume of the "Propaganda for Reform in Proprietary Medicines." The first volume ran through nine editions. The ninth edition contained (1) the most important reports of the Council on Pharmacy and Chemistry, (2) the reports of the A. M. A. Chemical Laboratory, and (3) those articles from *The Journal of the American Medical Association* which deal with the problems of proprietaryship in medicine and the furtherance of rational drug therapy. All of this material covered a period prior to 1917.

The present (second) volume contains similar material covering the period from January, 1917, to April, 1922, inclusive.

The index in this new volume is, in effect, a bibliography, including references not only to articles in the book but also (*a*) to articles which appeared in Volume 1; (*b*) to articles on the same general subject in *The Journal of the American Medical Association*, and (*c*) to articles appearing in the annual reports of the Council on Pharmacy and Chemistry and of the A. M. A. Chemical Laboratory, but not printed in either volume of the Propaganda for Reform in Proprietary Medicines.

This book is not only valuable for the information it contains, but it is also interesting. It shows up the technique of the artist in the sale of proprietary medicines, tells of his skillful word-pictures that are sent to the physician as "literature". It makes clear the work of the Council on Pharmacy and Chemistry, the A. M. A. Chemical Laboratory and *The Journal of the American Medical Association* in their several capacities as servants to the medical profession and as champions of rational medicine. The book should be in every physician's library, and more than that, should be within reach for convenient reference.

1920 COLLECTED PAPERS OF THE MAYO CLINIC, Rochester, Minnesota. Octavo of 1392 pages, 446 illustrations. Philadelphia and London: W. B. Saunders Company. Cloth, $12.00 net.

The annual volume of the Collected Papers of the Mayo Clinic is always awaited by the surgical profession with great interest. This volume, like the previous ones, appears under the editorship of Mrs. M. H. Mellish. It contains 118 individual papers by 60 contributors. A comprehensive work of this character cannot be systematically reviewed. Of course, there are certain papers which deserve special attention. C. H. Mayo's paper on Gastric and Duodenal Ulcers together with Carman's article on the Roentgen Diagnosis and Localization of Peptic Ulcer will be carefully read by everyone interested in the subject of gastric surgery. Pemberton's contribution to the Surgery of Substernal and Intrathoracic Goiters is very instructive. W. J. Mayo's paper on Mortality and End Results in Surgery will be read with attention and respect—he considers the results of the 10,280 operations which were performed in St. Mary's Hospital during 1919. Rosenow's Studies in Influenza and Pneumonia cover 145 pages. This work covers such a variety of subjects that it must appeal to the general medical profession. The Reviewer is willing to bestow the highest praise of which he is capable upon this volume.

DISEASES OF WOMEN. By Harry Sturgeon Crossen, M.D., F.A.C.S., Clinical Professor of Gynecology, Washington University Medical School, and Gynecologist in Chief to the Barnes Hospital and the Washington University Dispensary, etc. Fifth Edition. Revised and Enlarged. With nine hundred thirty-four engravings, including one color plate. Cloth, $10.00. St. Louis: C. V. Mosby Company, 1922.

It is a great pleasure to have placed before us again a new edition of Dr. Crossen's Diseases of Women. This book deserves its position as one of the popular American text-books. The author has made an earnest effort to bring all subjects up to date. One notes this effort particularly in the discussion of the advances in x-ray and radium therapy in their relation to malignant disease and uterine myoma. Dr. Crossen's teaching in regard to the treatment of carcinoma of the cervix uteri is fundamentally sound. He states: "In early operable cases, that is, in those cases apparently confined to

the uterus, I feel that immediate removal of the uterus and adjacent tissues likely to be involved is the safest plan," and "In order to give the patient the best chance in these early cases it is advisable to employ both radium and operation." His views regarding the present status of the treatment of myomata are in agreement with those of most pelvic surgeons. A new subject, dealt with in this edition, is Endometrial Cysts of the Ovary—the author closely follows the excellent article by Sampson (Arch. of Surg., Sept., 1921). The advances in endocrinology as it relates to gynecologic conditions has been noted by Dr. Hugo Ehrenfest, who wrote the chapter on this subject in the preceding edition. In the chapter on "Preparation for Abdominal Section" the reviewer notes with pleasure that Crossen has abandoned prolonged dieting and purging. It is interesting to read the following: "Formerly the author took particular pains thoroughly to saturate the patient with water before operation, for the purpose of aiding the kidney action after operation and diminishing the thirst, but he has discontinued the practice as a routine because he found certain drawbacks—the principal one being that it interfered with spontaneous urination after operation." The author is still among those who believe that every patient should have a bowel movement upon the third day after operation.

DISEASES OF THE THYROID GLAND. By Arthur E. Hertzler, M.D., F.A.C.S., Professor of Surgery in the University of Kansas School of Medicine; Surgeon to the Halstead Hospital, Halstead, Kansas; Surgeon to St. Luke's Hospital and St. Mary's Hospital, Kansas City, Mo., and to the Provident Hospital, Kansas City, Kansas. One hundred and six original illustrations. Cloth, $5.00. St. Louis: C. V. Mosby Company, 1922.

This book of two hundred and forty-five pages will be of interest to the surgeon who is familiar with the surgery of the thyroid. It is a pure, surgical monograph and is not entitled to the comprehensive title of "Diseases of the Thyroid". It is not a safe book for the tyro in thyroid surgery as it is wholly an exposition of Hertzler's ideas—and his ideas are not always sound. There is much truth in the author's contention that the small country hospital drawing its patrons from the immediate community is best able to study end results. Granting this statement it is unfortunate that in this book "the presentation of statistics has been designedly avoided". We are able to learn nothing regarding the number of the author's cases, his permanent cures or his mortality. He devotes about one page to the subject of Basal Metabolism and in this connection states "a good laboratory man may be of much help to the inexperienced clinician but to the experienced surgeon the aid is relatively little". Men like Crile and Lahey will enjoy reading that so far as the anesthetic is concerned "but two, ether and novocaine, need be considered though a few surgeons employ nitrous-oxide-oxygen anesthesia". The book is splendidly printed and the illustrations by Tom Jones are, of course, excellent.

INJURY, RECOVERY AND DEATH IN RELATION TO CONDUCTIVITY AND PERMEABILITY. By W. J. Osterhaut. Cloth, $2.50. Philadelphia and London: J. B. Lippincott & Company, 1922.

The author is professor of botany at Harvard University and the book is one of a series of Monographs on Experimental Biology. The author endeavors to treat certain aspects of biology according to the spirit and methods of the exact sciences. After an introduction takes up the problem of Methods of Measuring Electrical Conductivity, The Mechanism of the Process of Death, Injury and Recovery, Antagonism, Anesthesia, Conductivity and Permeability and concludes with a bibliography. This book will be read by anyone interested in the subject of experimental biology.

A MANUAL OF PHARMACOLOGY AND ITS APPLICATIONS TO THERAPEUTICS AND TOXICOLOGY. By Torald Sollmann, M.D., Professor of Pharmacology and Materia Medica in the School of Medicine of Western Reserve University, Cleveland. Second edition, entirely reset. Octavo of 1066 pages. Philadelphia and London: W. B. Saunders Company, 1922. Cloth, $7.00 net.

This work by a distinguished author is in its second edition and represents all the late advances and developments of pharmacology up to the present time. The revision has required that the book be reset from cover to cover and in doing so some valuable new features have been incorporated. The arrangement is especially desirable in that two sizes of type have been used throughout, the larger type giving a connected and concise statement of the essentials of pharmacology; the smaller type containing more detailed data for consultation. The author also has considered the practical uses to which the book will be put and those drugs that are generally used are given extensive consideration. The new drugs and remedies are emphasized with definite instructions for their use. The section concerning prescription writing is simple, easily understood, and will fully equip the student for the correct writing of prescriptions. The tabulation of average doses classified with reference to their importance will prove a ready and valuable reference. This new volume is improved by the addition of much knowledge acquired during the late war. The war gases and the newer antiseptics are included in the discussion. An extensive bibliography will prove valuable to those who wish to investigate subject further.

ENDOCRINE GLANDS AND THE SYMPATHETIC SYSTEM. By P. Lereboullet, P. Harvier, H. Carrion and A. G. Guillame. Translated by F. Raoul Mason, M.D., Instructor in Pediatrics New York Post-Graduate Medical School and Hospital, with the collaboration of Daniel R. Ayres, A.B., M.D., Assistant Professor of Gynecology, New York Post-Graduate Medical School and Hospital. Cloth, 378 pages. J. B. Lippincott Company, Philadelphia.

This American edition represents a translation of the original French text. Consequently it is an expression of the French viewpoint of endocrinology, and perhaps French physicians more than any others have been deeply interested in the subject and done most to put endocrinology upon a rational basis. Therefore, American physicians will welcome this translation of a new textbook containing the latest views on the subject from the French standpoint.

As the translator well says, there is no subject in medicine at the present time which has aroused such a widespread interest as endocrinology. On the other hand there is no subject that is so little understood and in the practical application of which so many extravagant claims have been made by enthusiasts. In fact we are inclined to believe that our French confreres, the authors of this textbook, may be classed as enthusiasts, even though they have tried to avoid extravagance in statement. That there are numerous disturbances of internal secretion giving rise to troublesome symptoms and pathological conditions we all will admit, and while it is entirely possible that many of these conditions are now amenable to treatment with glandular extracts, it remains to be proven to unbiased minds that glandular extracts are applicable in such a wide field of therapeutic use as indicated by the claims put forth by certain endocrinologists and in a measure sustained by even the authors of the textbook under

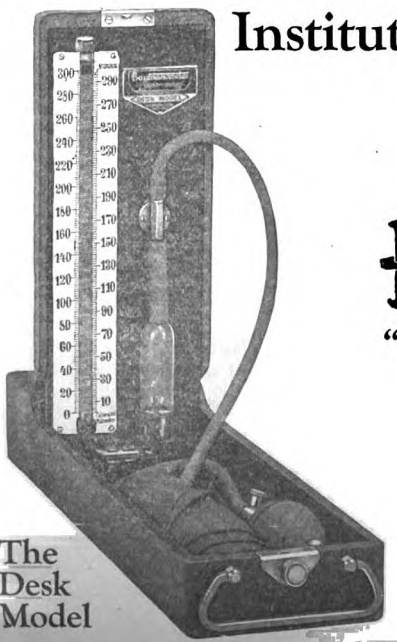
consideration. In the main the authors have been conservative, and are frank enough to state that certain recent facts have been omitted as not having as yet been sufficiently controlled by unprejudiced observers. The book will be read with profit and interest and the professional standing of the authors justifies a careful consideration of the subject as presented. The book probably represents the latest word in endocrinology from those whose opinions deserve some consideration. The chapters on the pathology of the sympathetic system are excellent and form a valuable addition to the work.

DISEASES OF THE SKIN. By Henry H. Hazen, A.B., M.D., Professor of Dermatology in the Medical Department of Georgetown University and Professor of Dermatology in the Medical Department of Howard University. Formerly assistant in Dermatology in the Johns-Hopkins University. Second edition. Cloth, 625 pages, $7.50. C. V. Mosby Company, St. Louis, 1922.



In preparing this second edition the author has rewritten the entire book with a view to bringing it entirely up to date as well as with a view to emphasizing certain features of most importance from a practical standpoint, as for instance, the pathology and treatment of syphilis, and x-ray and radium treatment of various diseases. The section upon eczema has been given special consideration in view of the changing ideas concerning the disease. A number of diseases not mentioned in the first edition have been included, and these are disturbances due to the vegetative nervous system, neavus and anemicus, and retention cyst of the lip. The author has succeeded in an endeavor to get away from the voluminous books which are not practical for either students or general practitioner. Very properly the author has emphasized the commoner skin diseases and their treatment. The illustrations, of which there are nearly three hundred, serve admirably in elucidating the text. The reader will appreciate the systematic way in which all of the subjects have been handled and the terse descriptions covering all phases of the discussion, including treatment. All in all, the book is a splendid text book for students and a valuable reference book for the general practitioner.

THE NEW HOME OF HYNSON, WESTCOTT & DUNNING OF BALTIMORE

This national drug firm has just erected and occupied its own building at Charles and Chase Sts. Baltimore. The building is artistic in appearance and adapted to accommodate the several departments of their rapidly developing business, which began in a small way in 1889, but has grown to a million a year, with an organization of 125 people. Their unique sales department alone comprises 19 men, who visit physicians in all parts of the United States but do not sell goods. Thirty-five of their products have been accepted by the Council and are advertised in this JOURNAL. None of their preparations are offered direct to the public but are introduced to the medical profession for the use of physicians and their patients. Mr. H. P. Hynson, one of the founders, died in 1921; but their growing business has now been established in new quarters under the immediate supervision of Messrs. James W. Westcott and H. A. B. Dunning (the latter being the active administrator), with a highly trained force, equipped to meet promptly the demands of the medical profession anywhere and at all times.

URINE IN SYPHILIS

The urine was examined by JOSEPH VICTOR KLAUDER and JOHN A. KOLMER, Philadelphia (*Journal A. M. A.*, Jan. 8, 1921) in forty-three cases of untreated primary syphilis, the duration of which was from a few days up to the time of cutaneous manifestations. Urinary abnormalities were present in three cases. The urine was examined in forty-six cases of untreated secondary syphilis. Urinary abnormalities were present in four cases. The positive cases all showed albumin and granular casts, excepting two in which casts were absent. In two cases, red blood cells were present. The albumin consisted of a trace, except that in two of the secondary cases a light cloud was present with many granular casts, and in one red blood cells. The urinary abnormalities disappeared after treatment with arsphenamin and mercury. The clear blood serum and the urine, from the same patient, were mixed for the presence of precipitin or precipitogens in serum or urine. The serums and urine of twenty acute untreated secondary cases were tested in this manner. The results were negative in all. Either the antibody is absent in the serum, or the antigen from the urine or both may be absent, as indicated by the results. The Wassermann reaction was performed with the urine of sixty patients with syphilis in the different stages of the disease, many presenting acute symptoms and being untreated. Every patient yielded a positive blood Wassermann reaction, the majority of reactions being strongly positive with three different antigens. Of the sixty cases, the urines in but two yielded positive reactions. There is no characteristic feature in the urine of paroxysmal hemoglobinuria of syphilitic origin which serves to differentiate it from the same condition due to other causes. Results with urinary tests for syphilis were of no value as a means to the diagnosis of syphilis.

PREVENTION OF DIABETES MELLITUS

An analytical study of a considerable number of cases, as detailed in various life and mortality tables, leads ELLIOTT P. JOSLIN, Boston (*Journal A. M. A.*, Jan. 8, 1921) to formulate this diabetic law: *It is rare for diabetes to develop in an individual above the age of 20 years who is habitually underweight, and when it does so develop the case will usually be found to be either extremely severe, extremely mild, or associated with a marked hereditary taint or degenerative stigma.* The tendency to diabetes appears to be congenital. It is more intense in childhood; but, escaping that period, the individual is less and less likely to acquire the disease if he remains underweight, whereas in the obese the tendency finds a fertile soil. In the fat the predisposition may be no greater, but the external cause is more provocative. Diabetes occurs seventy-nine times more often in those more than 20 per cent overweight than in those more than 20 per cent underweight. Nervous excitement or nervous strain has also been considered a factor in the etiology of diabetes. It is notable, however, that soldiers returning from the front did not show sugar in the urine. The preponderant influence of obesity on the development of diabetes explains various peculiarities in diabetic case histories. In the presence of a wasting disease, diabetes is almost unknown. If the principle of low nutrition is effective in treatment, how much more will it be effective in prevention! And this the statistics of the 1,000 cases analyzed by Joslin prove. For the prevention of more than half of the cases of diabetes in this country, no radical undernutrition is necessary; the individual is simply asked to maintain the weight of his average fellowman.

Little coughs often lead to large coffins.

The race is not to the swift but to the healthy. Keep fit.

LABORATORY PRODUCTS

HEADQUARTERS

Our facilities make us headquarters for the Endocrine Gland and Organotherapeutic products.

Pituitary Liquid ½ c. c. and 1 c. c. ampoules, 6 in box.

Pituitary powder and tablets. Anterior Pituitary Powder and Tabs. Posterior Pituitary Powder and Tabs.

Corpus Luteum (true) powder and 2 and 5 grain Tabs, and 2 and 5 grain capsules.

Pepsin, U. S. P. scale, granular and powder.

Pancreatin, U. S. P. Powder.

ELIXIR OF ENZYMES is a palatable preparation of the proteolytic and curdling ferments that act in acid medium. It is recommended as an aid to digestion and as a gastric tonic generally.

Elixir of Enzymes is of special service in correcting faulty proteid metabolism which is one of the principal causes of autointoxication.

Elixir of Enzymes is an excellent adjuvant and vehicle for exhibiting iodids, bromids, salicylates and other drugs that disturb the digestive functions. One dram of Elixir Enzymes will carry 46 grains of potassium iodid or 45 grains of sodium salicylate or 17 grains of potassium bromid.

Elixir of Enzymes contains the curdling ferment and may be used for making junket or curds and whey. Add one teaspoonful of the Elixir to half pint of lukewarm milk, stir thoroughly and let stand till cool.

For minimizing the organic disturbances and eliminating the corrosive effect of potassium iodid on the mucous membrane of the stomach as well as disguising the taste, the following combination is recommended:

Potassium Iodid, 2 ounces.

Distilled water, enough to make two fluid ounces.

To exhibit, for instance, 20 grains of potassium iodid three times daily, use one teaspoonful of Elixir of Enzymes, one teaspoonful of the above solution to half pint of lukewarm milk; stir thoroughly and let stand until cool. Take one-third of this quantity as a dose. This junket should be made up fresh every morning.

SAVE MONEY ON YOUR X-RAY SUPPLIES

Get Our Price List and Discounts on Quantities Before You Purchase

HUNDREDS OF DOCTORS FIND WE SAVE THEM FROM 10% TO 25% ON X-RAY LABORATORY COSTS

AMONG THE MANY ARTICLES SOLD ARE

X-RAY PLATES. Three brands in stock for quick shipment. PARAGON Brand, for finest work; UNIVERSEAL Brand, where price is important.

X-RAY FILMS. Duplitized or Double Coated—all standard sizes. X-Ograph (metal backed) dental films at new, low prices. Eastman films, fast or slow emulsion.

BARIUM SULPHATE. For stomach work. Finest grade. Low price.

COOLIDGE X-RAY TUBES. 5 Styles. 10 or 30 milliamp.—Radiator (small bulb), or broad, medium or fine focus, large bulb. Lead Glass Shields for Radiator type.

DEVELOPING TANKS. 4 or 6 compartments stone, will end your dark room troubles. 5 sizes of Enameled Steel Tanks.

DENTAL FILM MOUNTS. Black or gray cardboard with celluloid window or all celluloid type, one to eleven film openings. Special list and samples on request. Price includes your name and address.

DEVELOPER CHEMICALS. Metal, Hydroquinone, Hypo, etc.

INTENSIFYING SCREENS. Patterson, TE, or celluloid-backed screens. Reduce exposure to one-fourth or less. Double screens for film. All-metal Cassettes.

LEADED GLOVES AND APRONS. (New type glove, lower priced.)

FILING ENVELOPES with printed X-Ray form. (For used plates.) Order direct or through your dealer.

PROGNOSIS OF NEPHRITIS IN CHILDHOOD

A study was undertaken by RICHARD F. JAMES, Boston (*Journal A. M. A.*, Feb. 19, 1921) to determine (1) how many patients that had had acute nephritis recovered entirely; (2) how many developed the chronic type; (3) the present condition of the chronic type, and (4) the ultimate prognosis. Seventy children who had had nephritis the last sixteen years were examined. The examination included the cardiovascular system, hemoglobin, urinalysis, present health of the child, record of the patient's condition while under treatment and the etiology. Nine of the sixty-seven cases, or 13.3 percent, terminated in the chronic type, and of these only two could be considered severe. All of the sixty-seven patients who had had acute nephritis are living under normal conditions, on ordinary diet; and in every case the urine was found to be negative. Of twelve fatal acute exudative cases, one patient had an associated tuberculous peritonitis and one died of terminal pneumonia. Ten had general edema, two died of uremic convulsions; one patient having acute suppression of urine died following a decapsulation; one had associated acidosis. The point to be noted is that in none of the cases of the hemorrhagic type without edema did the patients die in the acute stage of the disease. In the group of twelve chronic cases, eight had albuminuria, four did not. In the urine of two patients, seen two years after discharge, a few red blood cells were found under high power. James believes that many patients with mild chronic nephritis recover. Diseased portions may recover even if there is considerable degeneration, and neighboring portions of the kidney may hypertrophy and carry on the extra work. In other words, an anatomically imperfect kidney can function efficiently. Many children will stand severe infections without acute exacerbations of nephritis, but they are more prone to follow upper respiratory infections. For this reason all foci of infection should be treated, such as diseased tonsils, carious teeth and otitis media (acute or chronic). They act as a reservoir of toxic material which the kidneys drain.

The perambulating dental clinics of the U. S. Public Health Service have proved that poor health makes poor chewing; and that poor chewing makes undernourishment and poor health. Particularly it urges that the "six year molars" of children should be watched. These are not the last of the first teeth, but the first of the last; and once gone they can never be replaced.

Strength and **Pliability** are Found in

Armour Iodized Sheep Gut Ligatures

which are made from lamb's gut selected in our abattoirs especially for surgical purposes.

The **Armour Iodized Ligatures** possess full tensile strength and their pliability prevents breakage at the knot. They are iodized to the core and are absolutely sterile. Regular lengths, sizes 00 to number 4 at $2.50 per dozen.

We also offer **Plain** and **Chromic Ligatures,** sizes 000 to number 4 regular lengths $2.50 per dozen, emergency lengths, $1.50 per dozen (nothing but the smooth side of the intestine is used in the manufacture of the Armour ligatures).

LABORATORY PRODUCTS

Suprarenalin Solution, 1:1000 is stable, uniform and free from preservatives.

Pituitary Liquid is physiologically standardized and is ready for hypodermatic use—½ c. c. ampoules for obstetrical and 1 c. c. ampoules for surgical use.

Literature upon the ARMOUR LABORATORY PRODUCTS for the medical profession only.

BOOK REVIEWS

PRINCIPLES AND PRACTICE OF INFANT FEEDING, by Julius H. Hess, M.D., Professor and Head of the Department of Pediatrics, University of Illinois College of Medicine; Chief of Pediatric Staff, Cook County Hospital; Attending Pediatrician to Cook County, Michael Reese and Englewood Hospitals, etc., Chicago. Illustrated. Second Revised Edition. Cloth, pp. 343. Price, $2.50. Published by F. A. Davis Co., Philadelphia.

This condensed little volume is a veritable treasure-box of practical facts concerning the subject of infant feeding. Certainly it more than justifies the author's purpose in getting away from the too voluminous text-books on this branch and is worthy a place in the library of every physician who feeds babies.

The changes incident to the second edition consist mainly in the recasting of the chapter on "Artificial Feeding" so as to establish as a basis for diets the coloric needs of the infant per pound of body weight of fat, carbohydrate, salts and water.

One might criticize the method of presentation of the subject of "relative acidosis" wherein the statement is made that the "acidity of the blood" was found to be increased. However, it is probably not intended as would seem to be indicated by such statement, except in a relative way, though a better phraseology would be to the effect that the alkalinity of the blood was reduced. This, however, does not detract from the very practical value of the book.

PERSONAL BEAUTY AND RACIAL BETTERMENT, by Knight Dunlap, Professor of Experimental Psychology in the Johns Hopkins University. Cloth, pp. 95. Price, $1.00. C. V. Mosby Co., St. Louis, Mo., 1920.

In this little volume a plea is made for the survival of the fittest from the standpoints of both individual beauty and conservation of the race. The author feels that in the mating of humans beauty plays a far greater part in the selection of the female than the male, and perhaps justly so, though with this quality there must be carried a highly developed sense of responsibility to the state on the part of both parents. Many of the sex problems are dealt with in rather wholesome fashion, particularly as they concern the social unit. All told it is a very interesting, and for the most part, rather logical little treatise.

DISEASES OF THE CHEST AND THE PRINCIPLES OF PHYSICAL DIAGNOSIS, by George W. Norris, M.D., Assistant Professor of Medicine in the University of Pennsylvania, and Henry R. M. Landis, M.D., Assistant Professor of Medicine in the University of Pennsylvania, with a chapter on Electrocardiograph in Heart Disease, by Edward Krumbhaar, Ph.D., M.D., Assistant Professor of Research Medicine in the University of Pennsylvania. Second Edition, Thoroughly Revised. Octavo Volume of 844 pages with 433 illustrations. Philadelphia and London: W. B. Saunders Company, 1920. Cloth, $8.00 net.

As stated in the preface to this edition, the exhaustion, in less than two years, of the first edition attests the need for such a work.

New features introduced consist of such subjects as Spirochetal Bronchitis, Influenza, Streptococcus Empyema, Chronic Inflammatory Conditions of the Lungs of Uncertain Etiology, Calcification of the Lungs, Pneumopericardium, etc., together with the recasting of considerable of the original text.

One of the most interesting chapters in the book is that on syphilis of the lung, a condition formerly considered relatively rare, but since the more universal application of the Wassermann test, found to be much more common than was formerly considered. A very practical point in the differential diagnosis between this condition and that of pulmonary tuberculosis, although not an infallible one, lies in the location of the lesions, viz., that syphilis usually attacks first the structures at the hilus and base of the lung, while the site of predilection for tuberculosis is commonly the apex. Indeed the work is full of just such practical suggestions and forms a most useful guide in that field for which it is intended.

An occasional typographical error was encountered.

SYPHILIS, DIAGNOSIS AND TREATMENT, by Loyd Thompson, Ph.B., M.D., physician to the Syphilis Clinic, Government Free Bath House; Visiting Urologist to St. Joseph's Hospital; Consulting Pathologist to the Leo N. Levy Memorial Hospital, Hot Springs, Arkansas. Second Edition, revised. Lea & Febiger, Philadelphia and New York. Cloth, $7.00.

No physician's library is complete without a late book covering the diagnosis and treatment of syphilis, and for the reason that such startling advances have been made in the knowledge of syphilis during the last few years. As the author well says, "The disease is no longer considered a genito-urinary disease, nor a dermatological disease, nor a disease belonging exclusively to any specialty; but it is to be thought of as a disease requiring knowledge in all fields of medicine." In the present volume an effort has been made to present the subject of syphilis in as practical a manner as possible, and accordingly a large portion of the book has been devoted to diagnosis and treatment. The chapter on Laboratory Diagnosis is made especially full, as today the desirability, in fact the necessity, of laboratory aid is more evident for the successful treatment of syphilis than for any other disease. The chapters on visceral syphilis have been rewritten, and contrary to the teaching of the previous editions, the luetin test is considered of little or no practical value and hence the section dealing with the subject has been greatly condensed.

All in all the book will be found to be a reflection of the latest and most approved facts concerning syphilis and we heartily recommend it.

PRACTICAL MASSAGE AND CORRECTIVE EXERCISES, WITH APPLIED ANATOMY, by Hartvig Nissen, President of Posse Normal School of Gymnastics; Superintendent of Hospital Clinics in Massage and Medical Gymnastics, etc. Fourth revised edition. F. A. Davis Company, London. Cloth, $2.00.

The popularity of this book is attested by the demand for the fourth edition. This new edition reports the results of what the author says is forty-five years of study and experience, practical and teaching a practical way to treat suffering humanity with mechano-therapy. The fact that the author has for twenty-four years been instructor and lecturer of massage and Swedish gymnastics at the Harvard University summer school, and also formerly was an instructor of physical training at Johns Hopkins University, is quite sufficient to stamp the author as a man of ability in his special field, and indicates the application of the work of the masseur as an aid in the treatment of the sick. The author very plainly states that he does not practice medicine, nor pretend to practice medicine, but claims to be a specialist in massage and corrective exercises which he gives in cooperation with members of the medical profession.
